EC&M

LINE-ARC
CONTACTORS

You can meet production demands better with EC&M Magnetic Controllers, because they are easy to get along with, easy to service on a preventive maintenance basis and low on upkeep.

The LINE-ARC principle keeps costs down and saves maintenance-time. Don't overlook these important advantages when buying mill and crane control:

- 1** Cool contact operation—longer contact life.
- 2** Lengthened Arc Shield life—the LINE-ARC principle centers the arc, so that destructive burning is eliminated.
- 3** Safer electrical interlocks—double-break, coin-silver contacts. The moving normally-open and normally-closed contacts are insulated from each other.
- 4** Foremost accessibility for inspection and part-replacement—delays prevented because maintenance is encouraged.

It pays to specify EC&M Control

Any Wire Problems?

If you use wire in your business, a huddle with Bethlehem metallurgists can help you find:

1. The right wire for any processing method.
2. The right wire for any application from coil springs to coat hangers, from conveyor belts to cotter pins.

One of our standard grades may fill the bill. Or your specifications may demand one of Bethlehem's special-purpose grades. Either way, you can rely on our careful selection of the proper grade, our close attention to manufacturing procedures.

Perhaps our wire-making experience can be of real assistance to you right now. Phone the nearest Bethlehem sales office or write to us at Bethlehem, Pa.

BETHLEHEM STEEL COMPANY, BETHLEHEM, PA.

On the Pacific Coast Bethlehem products are sold by Bethlehem Pacific Coast Steel Corporation. Export Distributor: Bethlehem Steel Export Corporation

BETHLEHEM WIRE

This formula helps an entire industry!

More and more firms in the chemical industry are coming to rely on this formula:

Barium Steel Corporation—best source for structural and steel plate, fabricated forms and finished products of steel, aluminum, magnesium, Fiberglas, plastics.

The reason for this conviction is that the group of strategically located companies comprising Barium Steel Corporation serves the chemical industry as a *unified* source for its structural and equipment requirements, controlling quality from blast furnace to end product, working as

a self-contained supplier of urgently needed material.

For example, in the scene above, workers at Barium's Central Iron and Steel Company are building a giant condenser shell from Central plate, which is also fabricated into tanks, heat exchangers and piping for the process industries. Other Barium subsidiaries (see photos below) supply the chemical field with a number of important components.

Whatever your industry, Barium can provide you with the same kind of service. For details, write Barium Steel Corporation, 25 Broad Street, New York City. No obligation.

BAYONNE BOLT CORP. • CENTRAL IRON AND STEEL COMPANY • CHESTER BLAST FURNACE • GLYDE IRON WORKS, INC. • CUYAHOGA SPRING COMPANY • EAST COAST AERONAUTICS, INC. • ERIE BOLT AND NUT COMPANY • GEOMETRIC STAMPING CO. • GLOBE FOUNDRY INCORPORATED • INDUSTRIAL FORGE & STEEL, INC. • JACOBS AIRCRAFT ENGINE CO. • KERMATH MANUFACTURING CO. • KERMATH LIMITED (CANADA) • PHOENIX BRIDGE CO. • PHOENIX IRON & STEEL CO. • WILEY MANUFACTURING CO.

THE HEAD of this Lummus Co. heat exchanger unit is securely fastened by bolts and studs specially made by Barium's Erie Bolt and Nut Co. Specialty studs for the industry are also produced by Barium's Bayonne Bolt Corp.

THIS INGOT in the blooming mill at Phoenix Iron and Steel Co. will ultimately become structural steel, which is widely used in the chemical industry for the construction of new processing equipment.

HEAT EXCHANGER manufacturers like Griscorn-Russell Company take heavy forgings of Barium's Industrial Forge Steel, Inc., and fabricate them into parts that resist temperature, high pressure and the corrosive action of chemicals.

PREFORMED INTERNALLY LUBRICATED

Wire Rope

for cranes, hoists, elevators,
and all equipment

From Macwhyte's complete line of a thousand and one sizes and types, you get the right rope for your equipment. Thoroughly lubricated, PREformed, engineered to give long, low-cost service. *Send for Catalog G-15.*

WIRE ROPE

Slings

for lifting and moving materials,
equipment in production or maintenance

There are hundreds of types and sizes of Macwhyte Round-Braided, Flat-Braided, Single-Part, and Grommet Slings. All are custom made in length, capacity, and flexibility to meet your needs. *Send for Catalog S-8.*

WIRE ROPE

Assemblies

for machine parts, controls,
and operating devices

Macwhyte Safe-Lock wire rope assemblies are made to order in length, strength, and flexibility desired. Terminals are permanently attached to one or both ends. There are many standard types. *Send for Catalog 5201.*

Production Trebled by the ***FASTERMATIC!***

Note here the rather simple tooling arrangement for machining cast iron sheaves. This setup, similar to regular turret lathe work, is made just as easily. But here, the machine performs 15 different operations—holds tolerances consistently—completes the entire machining job in 13 minutes. The former time was 39 minutes.

Completely Automatic Cycle

It's the swift, automatic cycle of the Fastermatic that accounts for such substantial time savings. With its hydraulic feed system and automatic speed control, the operator has only to load the chuck, start the machine and remove the finished work. Usually, the operator has time to tend a second machine.

Now, when you need still greater production, it is a good time to look into the Fastermatics. Write for the Fastermatic catalog.

THE GISHOLT ROUND TABLE represents the collective experience of specialists in the machining, surface-finishing and balancing of round and partly round parts. Your problems are welcomed here.

GISHOLT

MACHINE COMPANY

Madison 10, Wisconsin

Rough Casting

Finish Sheave

The Fastermatics are universal automatic turret lathes. Designed for accurate, high production turning, they can also be economically used on comparatively small lot work.

Behind the Scenes...

Mechanized

Automation and mechanization aren't an industry exclusive, as this wide-eyed report from one of our New York editors bears out: "Arrived at place of afternoon appointment five minutes ahead of time. Saw sign '3 Minute Shine,' investigated. Shine completed 2 minutes, 40 seconds. Reason: Battery of flexible shaft equipment beneath stands attached to brushes for buffing. Application of polish and final lick-and-promise with rag only hand operations necessary. Shine as good or better than normal type.

"Believe flexible shaft equipment and brush people missing fine potential market here. Spent next two minutes interviewing proprietor. Says equipment in use 16 years now, has several shops around city. Can be quoted as saying mechanization key to success but won't reveal annual sales or net worth; says he's not a candidate. Current problem is finding replacement brushes. Said I'd see what I could do. Made appointment on time."

Real Service

When Clark Bros. Co., Olean, N. Y., rolled out the carpet for machine tool editor Bob Huber recently, it turned out to be a flying carpet. One of the Clark planes flew down to Cleveland from Olean, picked up Bob and whisked him off to Olean.

The next day after a busy time at the plant the plane left with Robert aboard and made the hop back to Cleveland. According to his report, Bob must be about ready for his wings. He asked pilot Joe Decker enough questions about the plane that he should qualify for Editor in charge of Air Operations.

Teenage Slang Contest

Are you, by any chance, afflicted by the modern slang of a teenager in your happy home? Well, we are, and we'd like to start a little contest on just how corny you can get. As a starter, here's one that Ann tossed at us the other day when we said something that didn't seem to go

over too well: *There's a funny among us!*; says she and walks away while we stood there with a very silly expression on our puss.

The Perfect Squelch

Speaking of feeling silly, the life woman really put us in our place during Saturday morning breakfast. Apparently we'd been digging a little too hard for a compliment from the kids, and without looking up from the pancake griddle she said, "Sy, do you remember what Adlai Stevenson said in one of his campaign speeches?" "No", said we, surprised that such an ardent Ike fan had even listened to any of Mr. S's comments last fall. "Well," she quips, "he said that *flattery* was perfectly harmless as long as you don't *inhale!*" And that sort of ended that.

Special Report For Management

Floyd Lawrence, STEEL's new Detroit editor, just finished what he describes as the "assignment of assignments". Keep moving east from here and you'll find the results of that assignment in the form of an eight-page special report on community and public relations. "I interviewed people who spend half their lives arranging interviews for other people", says Floyd, "and how they loved to have the tables turned and be interviewed themselves for a change!" He's talking, of course, about the public relations experience he saw across the country while he was soliciting their opinions on how metalworking companies can do a better job of communicating with the public at large. STEEL's article is a summary of what these experts think about a big subject, and if you are interested in reprints they are available through the Readers Service Department with our compliments. This is the first of a series of special reports which will comprise a Program for Management during 1963. The next one will be on government-industry relations and is scheduled for late March.

Shrader

NOW 75-TON MULTIPRESS®

MODEL QA75

Big-job Multipress added to line

NOW — all production-boosting Multipress advantages can be applied to jobs calling for pressures up through the 75-ton range!

MANUAL OR AUTOMATIC CONTROL: A choice of nine control valves offers manual or automatic operation to suit any need. Dual-push button or hand-lever controls available for extra safety. Hold down and other operating sequences are easily provided.

VERSATILE RAM ACTION: The 15-inch maximum ram stroke of the new 75-ton Multipress is fully adjustable for both upper and lower limits. Pressing and approach speeds are *independently* adjustable. Continuous cycling of automatically controlled ram may be set for either distance or pressure limits.

MUCH CONTROL: With the New Multipress servo control added, the ram starts, stops, reverses, speeds up, slows down, or applies pressure *in direct relation to every action on the hand lever.*

INDEX TABLE FEEDS AND OTHER ACCESSORIES: Six- and 12-station Multipress Index Tables can be used for fast, automatic, multiple-point feeding or assembly of parts. Many other automatic feeds, auxiliary attachments and work-speeding accessories also available.

The 75-ton Multipress has a 30-inch daylight opening (gap) . . . 34-inch work table width . . . 13-inch throat depth. Height, only 106 inches. *Write today for full details on this versatile, big-job Multipress. Other sizes and capacities from one to 50 tons.*

After switching to Multipress, only three draws were needed to form heavy phosphor-bronze housings that required six operations by the former method.

With each ram stroke, Multipress puts 120 close-tolerance notches around a thin-walled compass bezel. Averaging 800 per hour, rejects dropped to .0025%.

With quick, accurate "one-shot" assembly of this 6-part metal and plastic switch component, Multipress boosted output 80% and cut scrap loss 84%.

Multipress increased production speed to 3 1/2 times the previous rate, in staking metal pins in a precision part of a famous-make 3-speed record changer.

the **DENISON Engineering Company** 1163 Dublin Road, Columbus 16, Ohio

HOW THE SLAYSMAN COMPANY REDUCED THREADING TIME BY 97%

The Slaysman Company, a large machine shop and parts sub-contractor in Baltimore, reduced threading time on one contract operation from 2 hours to 4 minutes by the installation of a LANDMACO Threading Machine.

This contract required the cutting of a 1" diameter 5 pitch Acme thread 29" long on C1141 steel to a Class 3 fit. Original production plans were to generate the thread by

milling. At the same time, even though the specifications and the hardness of the material seemed to preclude other methods, we were asked if we could suggest a more efficient threading process.

Based on our recommendation after studying the thread specifications, a 1½" LANDMACO Single Head Leadscrew Machine with an extra-long carriage was installed. The LANCO threading head was equipped with centering throat chasers with a roughing and finishing thread form. Centering throat chasers produce threads concentric with the outside diameter, and eliminate the out-of-round condition that often occurs when threading extra-long workpieces. The roughing and finishing thread form chasers cut coarse pitch threads with excellent finish in one pass.

Not only did this method reduce threading time from 2 hours to 4 minutes, but it also produced a very economical 50 pieces between chaser grinds. This is particularly impressive when it is remembered that the thread was 29 inches long and the hardness of the material threaded was near the limits of machineability.

Many other LANDIS machines are every day making significant savings producing all types of threads. Perhaps we may help you make similar economies in your thread production.

THE **LANDIS** Machine CO.

WAYNESBORO

Giant gas cooler is special feature of Dracco Dust Control system at smelting plant.
36 Dustomatic Filters (inset) are housed in building (right).

IS YOUR DUST PROBLEM ANY TOUGHER THAN THIS?

Dust recovery in the smelting business is difficult. Complicating factors such as high temperatures and severe conditions demand specialized engineering and equipment.

Consider the problem Dracco undertook at a large secondary smelter in Chicago, Illinois. Secondary smelting operations produce gaseous fumes at 2200° F. containing a valuable product, zinc oxide. Without efficient product recovery, the sub-micron size particles are lost in exhaust to the atmosphere. Dracco's job: recover the zinc oxide economically and efficiently.

Application engineering by Dracco furnished the answer. First, the gas temperature

is reduced to normal filtering temperature by specially designed water coolers, stainless steel lines and a giant U-tube cooler. Then, the 36-unit Dustomatic Filter system collects all zinc oxide automatically and continuously.* This Dracco installation has proved highly efficient and profitable.

Dracco Engineers with a broad background of experience in solving industrial dust problems are constantly at your service. If you have a tough problem in the control or recovery of dust, call in Dracco.

DRACCO CORPORATION
4090 East 116th Street, Cleveland 5, Ohio

"Industrial Dust Control and Recovery" is the title of a new Dracco bulletin. Write for your copy today.

Credit Where It's Due

Your article titled "Volume Plating Method Increases Gun Tube Life" (Nov. 17, p. 89) disturbs us. You err both in fact and by implication.

General Motors Corp. at Oldsmobile is undoubtedly doing a fine job of plating, but you give them undeserved credit and for the following reasons.

1. The Van der Horst Corp. was responsible for producing the gun tubes referred to before General Motors. As a matter of interest, the first pilot plant for evaluating the necessary technique is still in

BROACHES

MACHINES

Unified Broaching

FIXTURING

AUTOMATION

The New Trend...

the COLONIAL method

At Colonial, experience, imagination and competence are applied.

- 1 to the design and manufacture of each of the individual components of a complete broaching installation, and
- 2 to the effective combining of ALL components into a completely UNIFIED BROACHING installation—making them work as a "team."

3 Colonials Broach Intricate Aero Parts

Three Colonial broaching machines rough and finish broach these two mating aircraft engine parts. Six internal contours on the body are broached on a 15-ton Model RD pull-down (illustrated). The spider's external contours are broached on a Model RS 6-ton single ram and internal involute splines on a 15-ton Model RD pull-down machine.

Machines, broaches, fixtures, etc., were all designed by Colonial as a UNIFIED BROACHING INSTALLATION.

WHAT'S AHEAD IN BROACHING?

Keep up with the latest developments: Read "Broaching News". We will be glad to see you get it regularly if you will drop us a line on your company letterhead.

HEAVIER CUTS IN HARDER MATERIALS AT HIGHER SPEEDS

Get More Production with GORHAM "M-40-B" Tool Bits!

Get more out of your machine tools . . . raise your production curve . . . with Gorham "M-40-B" turning tools! Use "M-40-B" wherever the application of a Super High Speed Steel is indicated, as in machining heat treated alloy steels with large amounts of stock removal at high surface speeds.

"M-40-B" is a Super Moly grade with performance characteristics comparable to those of super tungsten high speed steel. It has extremely high red hardness, high Rockwell hardness, and offers maximum toughness and abrasion resistance. You can take heavy roughing cuts with it at high surface speeds and feeds . . . use it for high speed finish cuts as well.

"M-40-B" comes in square tool bits, 11 stock sizes, and in 23 stock sizes of rectangular turning tools. Bits and turning tools are accurately ground, uniformly hardened, ready to sharpen. Special sizes and shapes to your order. Illustrated with prices are three popular size "M-40-B" tool bits. See your distributor, or send direct for a trial order.

"M-40-B" is one of three cutting tool materials developed by Gorham. Others are Gorham "Standard", for the commercial field, and "Gormet", for turning soft or abrasive stock. They're completely described, with size and price lists, in a new free bulletin. Send for your copy today.

New G-E Oil-tight Units — Modern Design for Modern Machines

Machine operation is easier with these G-E units that retain color identification under continual use

An entirely new concept of push-button design means greater flexibility, easier installation, and longer life of these units on your machines.

VARIETY OF FORMS AVAILABLE

Interchangeable rings are available in five colors—will fit both push-button and selector switch forms. No need to order complete units to get a special color. Operators are available with extra large button, mushroom head, locking attachment, cylinder lock, and in combination units in addition to the standard push-button and selector switch forms.

One basic form of contact block fits these operators; is attached by means of two screws. You save time and money ordering or making up the forms you need.

COMPACT ENCLOSURES

In stations or enclosures these units are back mounted—simplifying wiring, and making a neat arrangement. Stations designed in accordance with JIC specifications are of strong, lightweight cast aluminum with a Buna-N gasket to keep out oil, water, and coolant.

BUILDING BLOCK CONSTRUCTION:

The same basic contact block is used on all push-buttons and selector switches. Double-pole, double-throw combinations are made by mounting two blocks on the same base. Tandem combinations with four contact blocks are easily made up using an adapter plate. Write for Bulletin GEA-5779. General Electric Company, Schenectady, N. Y.

Inventory is reduced with these G-E units that have interchangeable color rings, separate operators, and one basic form of contact block.

G-E SELF-A-LINE CONTACTS

ON MAKE:

When stationary contacts are misaligned movable contacts align with them.

ON BREAK:

Contacts always break evenly regardless of any misalignment of stationary contacts.

Wear is distributed evenly over both contact surfaces. Result: a 2:1 increase in life—by actual load-life tests.

LONG ELECTRICAL LIFE:

Unique self-a-line contacts assure equal distribution of arcing on the double-break contacts which prevents excessive and cumulative burning of the tips. Wipe on both normally open and normally closed contacts prevents false operation under vibration. Arc-resistant melamine contact block has long life.

ATTRACTIVE, BUT PRACTICAL:

Color stays clean and bright because it's anodized in the ring, and around the button away from area of use. Color coding can be seen from the side as well as the front. Smooth, rounded contour blends with modern machine design. Standard or extra-large nameplates available for all forms.

EASILY INSTALLED:

Contact blocks, operators and color rings can be assembled with little effort. Wiring is simple. Large pan-head No. 8 screws with terminal clamps easily take No. 12 wire and cannot be twisted off when tightened. Screw will also take solderless-type lugs. Only normal hand tightening is required to make unit oil-tight because of a special washer.

Reduced voltage starter

Heavy and standard-duty push-button stations

General-purpose relay

A-c and d-c solenoids

Roller-lever type limit switch

Rotating-type limit switch

TY PUSH-BUTTON STATIONS ARE ION RESISTANT—LONG LIVED

ed in a strong steel case, G-E
ty units have silver-tipped con-
n strong springs that stand up
stant vibration and use. Many
ions are possible with momen-
t maintained-contact buttons,
switches, and indicating lights.
rs are large for easy wiring. Large
ncircled by guard rings prevent
operation. Surface and flush
stations available. Bulletin
6 describes all forms.

RA TIMING WITH THIS RELAY— TEPLESS ADJUSTMENT

r press timing this relay has a re-
acy of 0.5 per cent of maximum
ng. Four forms available for
rations of 3 to 100 seconds up to 12
tes. 6 3/4 hours. Synchronous motor
n. Switch has both an instantaneous
open/time closed contact. For
timation on this easily adjusted
y write for Bulletin GEC-600.

STRONGBOX COIL MEANS EXTRA LONG LIFE FOR G-E MAGNETIC MOTOR STARTERS

This unique plastic-encased coil resists moisture, dust, and oil—cannot be damaged by a slipping screwdriver during wiring and installation. Permafil varnish, which does not liquefy in heat, prevents windings of Formex* magnet wire from abrasion under vibration and is sealed under vacuum so no "hot spots" can develop.*

Coil acts as permanently lubricated guide to moving magnet. No metal-to-metal friction.

*Reg. trade-mark of General Electric Co.

Sand Bonded with Permafil Varnish

Plastic Enclosure

Layers of Formex Wire and Paper

G-E Strongbox magnet coil has windings encased in molded plastic to prevent damage from vibration, moisture, dust, and screwdrivers.

The grooved sides of the plastic enclosure serve as guides to the moving magnet armature. A lubricant impregnated in the block reduces friction for fast, easy action at all times. There is no rubbing of metal against metal, so wear is reduced. Positive "make" and "break".

Wiring is easy. When the screw is backed off to make room for insertion of the wire, the clamps and lockwasher follow the screw head.

FRACTIONAL-HP MOTOR STARTERS HAVE EXTRA PROTECTION FEATURES

Bi-metallic overload relays take a variety of heater sizes—tab in operating handle quickly identifies rating. On overload, handle moves to OFF for position indication. Protection to contacts and overload relay is provided by a plastic enclosure within the steel case. The outer case has four 1/2-inch and two combination knockouts for easy mounting. Write for Bulletin GEA-2234.

Coils are easily interchanged, come in ratings of 110, 220, 440, 550, and 600 volts. Simply remove four easy-to-reach screws, and the coil slips out over the stationary magnet. Design is simple, compact. Coil terminals are front-connected, clamp-type—solidly anchored in the plastic enclosure—will not twist loose when tightened on the wire.

Ask for the starter with the Strongbox coil—it's an exclusive feature of all G-E a-c full-voltage magnetic starters in NEMA Sizes 0 through 3 for one to 50 hp motors. Write for Bulletin GEC-880.

ore information contact your nearest G-E representative, agent, or distributor or write Section B 730-43, General Electric Co., Schenectady 5, N. Y.

GENERAL  ELECTRIC

NOW you can BRIGHT-ANNEAL STAINLESS

on a continuous
production basis, with
The
SARGEANT & WILBUR
Controlled Atmosphere
CONVEYOR FURNACE

PARTS MADE OF STAINLESS can be

BRIGHT-ANNEALED,
BRIGHT-HARDENED, or

BRIGHT-BRAZED without oxidation . . .
they come out scale-free, bright, and clean.
No pickling required, no tumbling, no sand
blasting.

With our special S. & W. alloy for bright-
brazing stainless, the color matches the
metal; resists dulling; and the joint is practi-
cally invisible. Gold and silver parts are
soldered in the same continuous-production
furnace with equal success.

Your samples processed free. If you
want to see some of your own work bright-
annealed, bright-hardened, or bright-brazed
in a conveyor furnace, send us samples and
specifications.

DESIGNING AND BUILDING TOMORROW'S METAL WORKING

SPECIAL METAL WORKING EQUIPMENT...

Solving the tougher problems for the metal working industry has become habit with the Wean Equipment Corporation. From a simple slitting line to the complete design and construction of a military vehicle processing line Wean Equipment engineers have yet to leave a problem unsolved. On this page are examples of recent Wean jobs for the military. The top photograph shows two giant machines designed to perform precision grinding and drilling on the armor plate of tank hulls. The machines turn a slow, hand process into a production operation that completes the job 22 times faster. The bottom photograph is of a unique trans-car line that performs precision milling, drilling and boring operations on heavy vehicle hulls . . . at the same time solving the handling problem of these bulky pieces.

When you have a job that requires special machinery—large or small—you'll be sure to call in a Wean Equipment engineer.

INERY TODAY IS THE BUSINESS OF THE

EQUIPMENT CORPORATION
Wean
Cleveland, Ohio

WEAN ADVANCED SLITTING and FLYING SHEAR LINE...

's the most advanced flying shear line market-
oday. A line that can save you up to 20 per
on your steel costs because it can make 100 cuts-
minute to resquared tolerances. If you are a user
heet steel it will more than pay you to get in
with a Wean Equipment engineer and have him

prove to you how you can order your steel direct from
the mill, in coil form, eliminate expensive extras, and
make a saving amounting to almost \$20 per ton in
your final steel costs. You can't afford to overlook
this amazing new line . . . get in touch with Wean
Equipment in Cleveland, Chicago or Detroit.

WEAN WIRE MACHINERY

nt has for years been the
of wire machinery, and has
to design and build ma-
wire production and prac-

essing all along the line. If you make wire
or wire products you should know the Wean
Equipment man in your area. Products pic-
tured here are typical of Wean wire ma-

chinery, a 2-hi wire flattening mill, a nail
galvanizing unit, and a hexagon netting
machine that holds all records for the manu-
facture of this popular wire product.

Johns-Manville Insulations
save industry a billion dollars in fuel every year!

Reduce your fuel costs and build better furnace linings with **JM-3000 INSULATING FIRE BRICK**

IT'S THE ONLY insulating fire brick
which withstands a full 3000F. It's highly
resistant both as an exposed refractory
lining or as back-up insulation. And
JM-3000 is only one of six types of
Johns-Manville Insulating Fire Brick
made for these applications. All provide
long-life insulation. All are light
weight, have low conductivity, high
structural strength. These properties
permit thinner furnace walls—yet you
can achieve important fuel savings
and increased production, because
JM Insulating Fire Brick assures
quick furnace response.

O-Cel* Insulating Brick is an
outstanding J-M fuel-saver . . . a
load-bearing brick for back-up in-
sulation behind refractory linings. It
comes in three types, for service through
2500F—makes it possible to reduce the
necessary thickness of refractory linings
as much as one-third.

Save fuel with
J-M Hydraulic Setting Refractories

Johns-Manville refractories meet every
need for castable, troweling and gunning
applications for temperatures through
3000F. *Firecrete** is used to cast special
shapes of all kinds. It is ready for use
within 24 hours, has negligible shrinkage
and high resistance to spalling. *Blaze-
crete** is used to build and repair furnace
linings. When gunned, it adheres readily
with a minimum of rebound loss. When
slap-troweled, it eliminates laborious
ramming and tamping.

Save Fuel with J-M Aggregates and Fills

These lightweight insulations are used as
fills to conserve heat in irregular spaces
where other forms of insulations cannot
be economically applied. They are also
used as aggregates for mixing with other
materials to form insulating refractory
concrete.

*Reg. U. S. Pat. Off.

Send for your free copy! This new booklet
IN-115A gives full details about J-M insulat-
ing materials for service through 3000F. To
find out how they can help
cut your fuel costs, simply
mail coupon.

FIRST IN INSULATION

Curving Coiling and Ring Making

CURVING and coiling to almost any diameter, are two out of many operations which can be performed in a Yoder roll forming machine. As fast as formed, the sections can be continuously coiled and cut to length to make rings for auto hub caps, headlights, wheel trim, stator rings, etc., at a huge saving in cost of materials and labor.

Among other operations which can be tied in with cold roll forming may be mentioned embossing, notch-

IN A **COLD ROLL FORMING MACHINE**

ing, perforating, welding, flattening, lock-seaming, filling and closing tubular shapes, wrapping, edge trimming, etc.

In the design and assembly of production lines of this character, the know-how of the Yoder engineering staff is at your service. The Yoder book on Cold Roll Forming deals broadly with the most important phases of the subject. Ask for it

Split-second STOPS call for...

Here's a brake that has everything demanded of the most exacting service. Check over these valuable features:

NEW "CLOSE-COUPLED" COMPACTNESS that not only enables it to fit in limited space, as in machine tools and similar equipment, but also provides the rigidity and sturdiness to take the stress of constant sudden stoppage.

TORQUE ADJUSTMENT FROM THE OUTSIDE OF THE CASE.

TYPICAL APPLICATION — This roll-forming machine has to stop movement of the work exactly on a layout line. The Elliott Crocker-Wheeler brake motor does the trick.

PRACTICALLY NON-WEARING BRAKE ACTION, with metal-to-metal contact of "Velvetouch" discs and stationary plates for greater friction, quicker stops, and entire immunity to heat, cold, dampness, fungi, oil or grease.

QUICK-REMOVABLE WRAP-AROUND COVER enables inspection of all brake parts from the side of the brake.

SUPERIOR MAGNET CONSTRUCTION, up to the highest Crocker-Wheeler standards.

If you want a free-running brake that clamps down to an instantaneous dead-on-the-line stop when the power clicks off, this is it.

The Elliott C-W brake can be supplied with Crocker-Wheeler integral motor. It is also available as a separate unit for mounting on double shaft extension NEMA standard D flange motors, frames 203-326 or C face motors, frames 364-405. It needs no mounting brackets nor adapters.

GET THE BRAKE MOTOR BULLETIN

Ask your local Elliott field engineer, or write Elliott Company, Jeannette, Pa.

ELLIOTT Company

CROCKER-WHEELER DIVISION

16 operations

in 16 seconds

on an 8-inch, 6-spindle ACME-GRIDLEY Hydraulic Chucker

When Willys-Overland Motors, Toledo, O. changed methods to cut machining costs on larger production runs of this forged wheel spindle, they

decided to buy the machine on general claims. *They bought guaranteed end results—16 operations in 16 seconds.*

They bought a carefully engineered plan of tooling for this particular job—with hydraulic centering loader, die toolholder combinations for the 16 carbide tools, including 5 interrupted cuts on the flange at 860 S.F.M.

There is another reason—Willys-Overland, like all the big automotive firms, has employed scores of ACME-Gridley Bar Automatics from 10 to 30 years. Based on this experience, it is logical that they seek our advice

about advanced practices in tool engineering of Chucking Automatics.

For, no other source offers so much in design and tooling experience on bar and chucking automatics—more than 45,000 machines built.

For end results, cost savings, ask your engineers to contact ours.

JOB FACTS

PART	Front Wheel Spindle
SIZE	5 1/4" long, 4 3/8" swing
MATERIAL	Steel forging, AISI-C1040
OPERATIONS	16, all with Carbide Tools
MACHINE TIME	16 seconds (225 per hr.)

The NATIONAL ACME COMPANY

170 East 131st Street • Cleveland 8, Ohio.

Here's how we measure the **"Muscle"** in an Alloy Bar

Columbia alloy bars have muscle—and plenty of it. It's the kind of uniform strength that our many customers have learned to rely on, because each alloy bar is made to the same exacting standards as the last.

Only specially selected raw material is used. This material is subjected to a continuous series of tests (like the one shown

above) to verify its exact metallurgical content. What's more, each step of our production is rigorously Quality-Controlled by our laboratory to produce alloy bars that you can use in *your production* with minimum treatment and waste. • More product information—technical assistance, too—are yours for the asking. Call or write today.

Columbia STEEL & SHAFTING COMPANY

Pittsburgh 30, Pennsylvania

SPECIALIZING IN COLD FINISHED STEEL BARS and SEAMLESS STEEL TUBING

Modernization pays off!

**6 MACHINES NOW DO
THE WORK OF 17**

● As part of their modernization program, Otis Elevator Company replaced 17 machines with 6 Warner & Swasey 5-spindle Automatics. These automatics are used at Otis for short runs on specially-machined parts—studs, bolts, nuts and other screw machine products—required for custom-made elevators.

The results of this modernization program: increased production in less floor space, more uniform parts, and six critically needed men released for work elsewhere in the plant. At Otis only 3 men are required to set up and operate these 6 automatics.

Because of its quick setup and ease of operation, the Warner & Swasey 5-spindle Automatic makes automatic production economical on short runs as well as large lots. It's a machine designed to meet the requirements for lasting accuracy and increased production for the years ahead.

The Warner & Swasey 5-Spindle Automatic line at the Yonkers Works of the Otis Elevator Company.

YOU CAN PRODUCE IT BETTER, FASTER, FOR LESS WITH WARNER & SWASEY MACHINE TOOLS, TEXTILE MACHINERY, CONSTRUCTION MACHINERY

STANICUT

TRADE MARK

Cutting Oil

Tapping problem solved; production boosted 25%

● A midwest manufacturer was having trouble with a thread tapping operation. Performed on the drill press shown above, the job called for the tapping of a $\frac{3}{4}$ -inch threaded hole in nuts made from C-1018 steel stock. The quality of threads tapped was poor. Rejections ran high because of torn threads.

Consulted on this problem, a Standard Oil lubrication specialist recommended the use of STANICUT Cutting Oil 309 BCS. Replacing a conventional cutting fluid, STANICUT turned the tide on troubles. With its use, quality of threads has been excellent. Rejections have been reduced to

a minimum. Production has been boosted 25% — an increase of approximately 100 pieces per hour!

Whatever your cutting oil problem, a Standard Oil lubrication specialist in your section of the Midwest can help you solve it. Backed by one of the most complete lines of cutting oils on the market, he has the training and experience to apply those products most effectively. You can contact him by phoning your local Standard Oil (Indiana) office. Or write: Standard Oil Company, 910 South Michigan Avenue, Chicago, Illinois.

What's YOUR problem?

D. F. Wallace of the Standard Oil office in Saginaw, Michigan, is the lubrication specialist who helped this midwest manufacturer solve a serious problem through the use of STANICUT Cutting Oil.

Like all Standard Oil lubrication specialists, he has a broad background of practical experience plus thorough training in Standard's own schools. And like all lubrication specialists, his on-the-job help is always available. He is one of a corps of experienced men who make their headquarters wherever industry is located throughout the Midwest.

For help with your problem, call for the services of your Standard Oil lubrication specialist today! A call to your local Standard Oil office is all that's necessary.

STANDARD OIL COMPANY
(INDIANA)

Compressors give carbon the air. Hayes Industries, Jackson, Michigan, had air compressor trouble caused by formation of carbon on valves. With the change to STANOIL Industrial Oil, compressors gave the air to carbon troubles and have breezed through four years of hard operation without difficulty. Over the oil previously used, STANOIL has given four times longer service in crankcases.

No drips in this press room. STANODRIP Dripless Oil solved a press room lubrication problem at A. O. Smith Corporation Kankakee Works. It put a stop to drippage of oil from bearings on stamping and punch presses. Results: cleaner and safer working conditions, less lubricant consumption, fewer applications of lubricant.

*Built & Sold by Waterbury-Farrel

SCREW SLOTTING NEWS

REVOLUTIONARY, NEW WATERBURY-FARREL MACHINE SLOTS 500 TO 2000 FINISHED BLANKS PER MINUTE

Unprecedented Saw Life Per Grind

This new Waterbury-Farrel #1 High Speed Screw Head Slotting Machine uses only one hopper, one dial and one saw to pour out from 500 to 2000 burr-free, slotted blanks per minute.

Capacity

Slots button, round, flat,

flat oval, fillister, truss or binder heads (of brass or standard lower carbon machine steel), in sizes from #6 by $\frac{1}{4}$ " minimum length to $\frac{1}{4}$ by 3" overall maximum length. Speeds of from 500 to 2000 per

min. depend upon shape and size of head and whether steel or brass is used.

Fully Electrically Driven ...
Lubrication Safety Interlocked
Panel board control

switches are safety interlocked so that oil flow must be started first. Then the saw, dial and feed are each started in that order by separate switches.

For further information on this outstanding new production machine, contact Waterbury-Farrel.

PRODUCTION EXAMPLES:

#6 Brass Binder Head
Screws . . 72,000 Per Hr.
 $\frac{1}{4}$ " Steel Flat Head Screws
42,000 Per Hr.
With Burrs Removed
#8 Steel Button Head
Screws . . 120,000 Per Hr.

Sure cure for the "shakes"

UNDER the terrific vibration of aircraft engines, screws and nuts have a tendency to become loose. That's why Army, Navy and Air Corps specifications call for safety wiring on engine mountings, instruments, gun sights, magnetos . . . every place on a plane where a screw or nut might shake loose.

By simply drawing the lock wire through a small hole in each nut or screw, and then twisting tightly with pliers, a positive sure cure for the "shakes" is provided.

Wire for this important function must be highly resistant to corrosion, tough enough to resist frac-

turing under the heat and vibration of aircraft engines, and soft enough to twist with pliers for quick assembly and replacement of parts. Here at National-Standard we've developed a type of slow-annealed stainless steel wire to fully meet these exacting requirements. And we're drawing millions of feet of this wire, not only for aircraft but also for many other automotive applications.

Developing special wire for special purposes has been an important part of National-Standard's business for more than 45 years. Perhaps our unique engineering and manufacturing facilities can help you with your wire and wire fabricating problems.

Whose cheese is being divided?

TWO cats could not agree on fair division of a tasty cheese. "Let's go to the monkey," said one, "He is all-wise and can divide our cheese fairly." So to the monkey they went.

The monkey immediately broke the cheese evenly and judicially put the two pieces on the pans of his balance. But one was slightly heavier. He shrewdly nibbled that piece a bit and put it back on the scales. Now it was the lighter piece. So he bit off some of the other piece only to find it the lighter. Thus while the two hungry cats watched, the monkey kept taking bites of the cheese, first one piece, then the other, until finally the cheese had almost disappeared.

"What's left is too small to divide," sagely pronounced the monkey, as he popped the remaining fragments into his mouth.

Observers of the American scene see a direct parallel between the record of federal taxation and this ancient parable of the trusting cats, the greedy monkey and the cheese. Business and the individual citizen have been content to trust government to rule on the disposition of their earnings. And Uncle Sam keeps taking bite after bite out of the shares of both individual citizen and business.

Already government bites are so large as to severely penalize citizens and business alike. If allowed to continue, it will seriously impede further industrial progress and growth, stifle initiative and threaten the strength of our free enterprise system. Beware the day—goal of the socialists among us—when the monkey says "What's left is too small to divide."

PRODUCTION-WITH-ACCURACY MACHINES AND EQUIPMENT

Accumet Precision Castings for *all* industrial uses

With Accumet Precision Castings, Crucible has developed a process of producing precision investment castings in intricate designs with the smooth, satiny finish and closely-held dimensions characteristic of "lost wax" castings. Casting tolerances

start at plus or minus 0.005" although under certain circumstances closer tolerances can be held. This relatively new metal forming process solves many difficult problems in design, tooling and production of metal components.

fuel injectors from precision castings

Fuel injectors and carburetors for aircraft are mechanisms containing a variety of peculiarly shaped component parts. The usual procedure is to use hardenable, chrome stainless steels, Types 416 and 440F, which are most adaptable to easy machining. However, to save costs in machining from bars, stocks and forgings, Crucible applied Accumet Precision Castings. The close size control and good surface finish of the castings eliminate many costly machining operations — saving manpower, machine time and tooling expense.

more information available on castings

Long a leader in the development of precision investment castings, Crucible offers you the services of an alert metallurgical staff to help you profitably apply these specialty steels to your operation. Write

KEEP 'EM ROLLING with TEXACO REGAL OIL

HERE'S HOW: The oil film bearings of your back-up rolls will do a better job for you, and cost you less for maintenance when they're protected with *Texaco Regal Oil*. This turbine-quality oil stands up under heavy loads and high temperatures.

Texaco Regal Oil resists oxidation, emulsification and sludging. It keeps the oil lines clear, permitting clean, cooling lubricant to flow constantly to the bearings. Your bearings last longer. Your costs come down. There is a complete line of *Texaco Regal Oils* to meet your exact requirements.

Over on the drive side, the best protection for enclosed reduction gears is *Texaco Meropa Lubricant*. Its high and lasting EP properties assure longer gear life and lower maintenance costs.

Talk to a Texaco Lubrication Engineer. He can help you "keep 'em rolling." Just call the nearest of the more than 2,000 Texaco Distributing Plants in the 48 States, or write The Texas Company, 135 East 42nd Street, New York 17, N. Y.

TEXACO Regal Oils

(HEAVY CIRCULATING OILS)

TUNE IN . . . TEXACO STAR THEATER starring MILTON BERLE, on television Tuesday nights. METROPOLITAN OPERA radio broadcasts Saturday afternoon.

Now that production ceilings have been removed from automobiles, the industry undoubtedly will be able to turn out 6 million cars in 1953. The real question is: Can it sell 6 million? It sold about 4.3 million in 1952, 5.6 million in 1951 and nearly 7 million in 1950. The answer to the question will have a big bearing on steel's availability for the rest of the year. Many steel market analysts are betting that the auto men won't be able to sell quite 6 million cars. That's one reason why the Steel Products Industry Advisory Committee, meeting Feb. 17 to discuss decontrol, said that it's now "safe" to open-end CMP. It wants NPA to go even further and announce at once that all distribution controls will end July 1 except for steel required by the military.

Basic metal prices will be decontrolled last. So, look for OPS to allow some more price increases in that area, even though all curbs will have to end Apr. 30. In the works is authority to boost chromium by 3 or 4 cents a pound according to use, cobalt by 30 cents a pound, beryllium by 5.22 cents a pound and nickel and chromium needed in stainless steel by 2 or 3 cents a pound according to use. The nickel ceiling has already risen by 3.5 cents a pound.

Copper and brass mill production for 1953 should be higher than for 1952. That's the opinion of Herman W. Steinkraus, chairman and president of Bridgeport Brass Co. His company's January sales were 10 per cent above those of January, 1952, and the entire first quarter should be just as good. He also predicts that more copper will be available this year than last.

Prospects for tax cuts are still dim, despite the House Ways & Means Committee's approval of Chairman Daniel Reed's bill to reduce them. The bill will be held up by Republican leaders. Treasury Secretary George M. Humphrey reiterates that a budget balance must come before tax cuts. The Truman budget with its \$9.9 billion deficit is now making the rounds of the federal agencies involved. Their instructions are to cut to the bone.

CIO President Walter Reuther has his troubles. Besides trying to maneuver the auto companies into opening their five-year contracts two years early, he has been able to place a CIO man in only the number three Labor department job while AFL men sit in the first two spots. The United Steelworkers, second-largest union in the CIO, is disgruntled with Mr. Reuther's leadership, and rumors persist that it may bolt to the AFL. To top off all his difficulties, the CIO pres-

ident is getting nowhere with his pet project to merge with AFL. The latter group, figuring that it now has improved strength, is currently much cooler to the proposal than it once was.

Postponed: Resources Conference

Resources for the Future Inc., subsidized by Ford Foundation, will postpone until the fall its widely publicized conference on natural resources policy which was scheduled in Washington for Mar. 25-27. The conference was to have thrashed out Paley Commission recommendations. It was postponed at White House request because President Eisenhower wants to study the Paley report in greater detail and because the U.S. Chamber of Commerce impressed him with its charges that the conference would be strongly New Dealish in tone.

Test of Strength

One of the first major tests of President Eisenhower's strength in Congress will come over his foreign trade policy. His decision to reject tariff boosts on briar pipes is one of the latest indications that he favors lower duties and freer trade. His free-trade thinking will be supported by a study soon to be released by the Public Advisory Board for Mutual Security. The report is said to recommend some tariff reductions and more U.S. buying from allies.

More Needle Bearings

The shift to automatic transmissions by auto buyers is proving a bonanza to manufacturers of needle bearings. Some 240-280 are required per unit. A car equipped with the shiftless device now takes a total of about 400 needle bearings. Last year 2.1 million new cars were equipped with automatic transmissions.

Straws in the Wind

Nonfarm employment in January was 1.3 million higher than a year earlier . . . OPS says that all sellers must retain their records even if their products have been decontrolled . . . Carrier Corp. expects five times as many room and full-house airconditioning installations this year as last . . . The Federal Reserve Board is cool to the idea that consumer credit controls should be re-established to cut down the volume of consumer debt.

What Industry Is Doing

The open-ending of the Controlled Materials Plan won't be of great practical value in the first half of 1953 (p. 45) . . . Japanese and Western European steel producers battle for the shrinking U.S. import market (p. 46) . . . Avery C. Adams, president of Pittsburgh Steel Co., says that steel mills will probably operate at capacity throughout 1953 (p. 47) . . . Makers of industrial brushes did a \$60 million business in 1952 and expect to sweep up higher sales in the years ahead (p. 48) . . . Sharp variations are occurring in the sales growth of different metalworking industries (p. 49) . . . Kaiser Aluminum & Chemical Corp. opens its bauxite mining facilities in Jamaica (p. 50) . . . Imported aluminum is snapped up by U.S. fabricators (p. 50) . . . College graduates are drawing a premium price in the industrial market (p. 51).

PUTTING *Air* TO WORK FOR FIBERGLAS

Without an infallible air supply at many process stages, Owens-Corning could not make their famous Fiberglas.

FAN THE FIRE TO MAKE A MILLION MARBLES

machines swallow glass at 2200°F, spit out 320 red-hot marbles a minute. Today, they produce more than a million marbles to feed forming machines, turning out a multitude of Fiberglas products.

Air plays a vital role in many ways in making. Take, for example, the combustion air to the glass furnace. If it is off for only a short time, the furnace melt would be lost and it would take a week to rebuild the furnace. Throughout this huge plant, over

150 Sturtevant fans like those pictured at right give production an assist by *putting air to work* in both cooling and heating processes.

Our specialty is making air work for you . . . with a complete line of air handling, air conditioning and air cleaning apparatus. For help on your problem, call your local Westinghouse-Sturtevant office, or write Westinghouse Electric Corporation, Sturtevant Division, Hyde Park, Boston 36, Massachusetts.

Sturtevant fans keep furnace exteriors cool, prevent refractory brick from disintegrating.

Tiny fibers of glass are formed into Fiberglas mat by air, put to work with Sturtevant fans.

Heavy-duty fans drive air at high temperatures through Fiberglas mat to cure bonding agent.

YOU CAN BE SURE...IF IT'S
Westinghouse

Stainless structural parts for airplanes.
White rule represents 6 inches.

50% GREATER DESIGN STRENGTH With Armco 17-7 PH

Vital formed structurals in certain airplane fuselages formerly were made of Type 301 half-hard temper stainless steel. Here is what the manufacturer gained by changing over to Armco 17-7 PH Stainless Steel:

50-94% INCREASE IN YIELD STRENGTH

Instead of a yield strength in tension of 110,000 psi minimum, he had his choice of yield strengths as high as 165,000 psi minimum in finished parts.

Yield strength in compression could be increased correspondingly from 85,000 psi to as high as 165,000 psi minimum.

23% INCREASE IN TENSILE STRENGTH

Ultimate tensile strength of the finished structural parts could be increased from 150,000 psi minimum to as high as 185,000 psi.

IMPROVED WORKABILITY

Fabrication difficulties were also overcome. Half-hard temper Type 301 must be worked in the hard condition. With an elongation of only 15-18 per cent in 2", it is difficult to form and results are often inconsistent.

On the other hand, Armco 17-7 PH may be worked in the fully annealed condition and hardened by heat treatment *after fabrication*. With an elongation of 20-40 per cent in 2", it will take far more severe forming than Type 301, half-hard. Its high strength is developed through a double low-temperature heat treatment of 1400 F plus 950-1050 F. Scale developed in heat treatment comes off readily in sandblasting.

This is but a thumb-nail sketch of the advantages of Armco 17-7 PH in structural applications. Write for complete information on this precipitation-hardening chromium-nickel stainless steel.

P. R. Is Every Company's Job

While the United States government was in the hands of "new dealers" and "fair dealers," the term "private enterprise" became such a political football that a large segment of the American public became confused as to its true meaning and its real economic significance. While it is true that Presidents Roosevelt and Truman frequently gave ardent lip service to private enterprise, at the same time some of their associates lost no opportunity to damn it with faint praise and a few actually planned for its ultimate destruction.

Now that the climate in Washington has changed, there is an excellent opportunity for loyal proponents of competitive private enterprise to demonstrate its virtues. This task calls for a public relations performance on the part of American industry on a scale that surpasses anything it has attempted previously.

The job can be done if management will get behind it determinedly. Today more specialists trained in public relations are serving industry than ever before. Their techniques are being improved constantly. They are learning from past mistakes. At long last it is widely recognized that the basic foundation of effective public relations is the good day-to-day behavior of a company. The best P. R. man in the world cannot make a saint out of a sinner.

Naturally in the evolution of public relations activities, some companies have led the field, others have followed and some have dragged their feet. In its recent fifth annual report on American industry, *Forbes* magazine graded numerous corporations on their public relations performance. Of the scores of metalworking companies included in the study, only two were rated above 90 in public relations. General Motors and American Locomotive each scored a 95.

That a few companies in each industry group do an outstanding public relations job is encouraging, but it is not enough. What is needed is a concerted effort by every unit in every industry to do the best public relations job of which it is capable.

American competitive private enterprise will not be accorded the public esteem it deserves until good public relations becomes the rule rather than the exception.

EDITOR-IN-CHIEF

PROVOCATIVE OPTIMISM: In addressing the New York Society of Security Analysts, Avery C. Adams, president of Pittsburgh Steel Co., began by saying, "Let me warn you that I am an optimist for the simple reason

that I know our day-to-day problems can best be solved by an optimistic, positive and aggressive approach to them, rather than by a pessimistic, negative and vacillating one."

Whereupon he demonstrated his optimism by

predicting (p. 47) capacity operations in the steel industry for 1953. He also cited relationships between the demand for steel and such factors as Gross National Product, increases in population and increases in the consumption of steel per capita. On the basis of projections of these relationships, he predicted that the increased demand for steel will call for an addition of 20 million tons of ingot capacity from 1952 to 1962.

Admitting that the industry's breakeven point is rising, he said that "when the going is tough, we have found ways and means to cut costs." It was a thought-provoking address.

* * *

FAITH WILL SOLVE IT: Reports from Washington indicate that it may be difficult for the government to induce businessmen to accept some federal offices which still remain open because of the sacrifices made by Charles E. Wilson and others who disposed of large stockholdings in order to qualify. Many able executives cannot afford to do what Mr. Wilson and others have done.

An easy solution would be to relax the law (p. 62), but that may not be the best way in the long run. Right now our own country and others are at the crest of a wave of cynicism. The poison of several decades of calculated smearing has almost destroyed man's faith in men of proved integrity.

As we emerge from the horrors of maliciously planned character assassination, we may in due time return to the basic idea that a man is honest until proven guilty.

* * *

AN OVERDUE REFORM: Rep. Fred E. Busbey of Illinois introduced a bill in the House of Representatives that would create a commission of representatives of private industry to examine the 80 federal agencies that are engaged in direct competition with private enterprise. Apparently the resolution is aimed particularly at government encroachments upon the domain of privately-owned power facilities. The House action is paralleled by a Senate drive which in addition to curbing government competition with private business (p. 62) would also put the Reconstruction Finance Corp. out of business.

These moves are in the right direction. A

thorough study probably would show that the federal agencies that are doing things incompetently that private operation could do much better far exceed the 80 designated. Practically every department has agencies which are rendering services which private enterprise is better qualified to perform, and at a profit from which the federal government could collect taxes.

* * *

HEADING FOR TROUBLE: In the light of recent utterances on foreign trade, the nation must give President Eisenhower and Henry Ford II grades of A plus for courage. Both have come out strongly for streamlining the mechanics of trade between nations, which has been and still is one of the world's most controversial subjects.

Mr. Ford (p. 61) is for a law encouraging rapid elimination of all tariffs, abandonment of the quota system and the Buy American Act, and for simplification of custom procedures. The President is for a freer flow of trade and reduction of red tape in customs, hedged only with some consideration for domestic producers who would be affected drastically.

This issue is of paramount importance and we might as well get it out in the open and go at it hammer and tongs. But it's going to be difficult and painful.

* * *

FREEZING IN INDUSTRY: Readers of technical articles in the business press will have noticed more frequent references to the role of refrigeration in industry. Two typical examples appear in this issue.

Weston Electrical Instrument Corp. found it necessary to develop rigid tests for electrical indicating instruments so that their performance under adverse operating conditions can be studied. One of the tortures to which they are subjected (p. 84) is to place them in cabinets in which the temperature is -55°C . Lockheed Aircraft Corp. installed a $40 \times 12 \times 10\frac{1}{2}$ foot freezing chamber (p. 99) in which large metal parts of airplanes can be stored between fabrication operations. It can cool 2500 pounds of aluminum from room temperature to -20°F in 2 hours. Parts removed from cold storage are more easily workable and there are other important advantages, too.

MEET THAT DEADLINE with Metal Stampings from Firestone STEEL PRODUCTS CO.

LATEST-TYPE heavy-tonnage presses, like the one shown here, and closely integrated assembly operations enable Firestone to provide ON SCHEDULE delivery of your large, heavy metal stampings.

If you need stampings in a hurry

and must keep costs low, it will pay you to figure with Firestone. For a complete cost analysis on stainless steel, carbon steel or aluminum stampings and sub-assemblies, write to Firestone Steel Products Company, Metal Stampings Division, Akron 1, Ohio.

Looking for Steel?

Here are some timely suggestions

Steel stocks at your nearby Ryerson plant are improving steadily. However demand continues strong; so the steel you want may not always be on hand when you call. With this in mind, we offer the following suggestions which some of our customers have found helpful in making the most of available steel under today's difficult conditions:

1. When new products or models are still in the designing stage, a pre-check with your nearby Ryerson plant may enable you to adapt designs to the most readily available types and sizes of steel. Thus you may avoid difficulty when ready for actual production.

2. When ordering steel, tell us to what size or length you plan to process it. With this information to guide us we can often meet your requirements with selected shorts, even when we do not have uncut stocks of these items on hand.

3. Let us know the end use, or properties needed in the finished product. Then, if the

steel you specify is not in stock, our metallurgists can often suggest an alternate size or analysis which will do the job and *is* available.

4. Give us a list of the steels you need, or will be needing in the near future. Keep us posted. We will check our incoming stocks daily against your requirements, let you know promptly when the steel you want becomes available.

5. Visit the Ryerson plant nearest you. Get acquainted with the Ryerson men who specialize in the types of steel you use. Discuss your steel problems with them. Learn—first hand—about Ryerson facilities and services. Such direct contact may prove worthwhile in many ways.

These suggestions are prompted by a sincere desire to be of help to you. So whenever you need steel—call Ryerson. We will always be glad to work closely with you.

FREE METAL SUPPLY? —Only a Trickle

SUPPLY & DEMAND
Second Quarter, 1953

CARBON STEEL
(Net Tons)

COPPER
(Pounds)

ALUMINUM
(Pounds)

CMP Allotments*	26,168,000	1,602,055,000	850,039,000
Estimated Supplies	22,778,000	1,340,000,000	740,000,000

* Allotments for civilian-type products are set at 90 per cent of pre-Korean base period use for steel, 50 per cent for copper and 60 per cent for aluminum. All CMP tickets are never cashed, so the actual CMP claims on supplies will be lower than official allotments. This "slippage" in the past has been about 15 per cent for carbon steel, 20 per cent for copper and nearly 25 per cent for aluminum. What it will be with open-ending is anybody's guess.

gest mill buyers, so they'll get the biggest quantity of freely distributed steel.

The products in which there is likely to be free tonnage include wire rope, nails and other wire products, tool steels, some sizes of hot strip, straight chrome steels cold alloy bars, some cold carbon bars, hot alloy bars and galvanized sheets. Production directives will hold throughout the first half, and that should minimize the shifting from one product to another of more profitable nature—so long as demand holds.

No Disruption—The modification of CMP is not creating undue disruption in the steel markets and probably won't for the next four months. That's because the production directives, the set-asides, self-certification and CMP allocations are still in effect. Some of the premium-price mills may have capacity to roll freely distributed steel long before the regular mills do, but the total tonnage from that source won't be large.

Some smaller consumers interviewed by STEEL are worried that open-ending will put them at a disadvantage when competing for what's available with automotive and other large consumers. But even they hail the move by NPA as a sound one.

CMP Open-Ending: Little Help

OPEN-ENDING of CMP is a step in the right direction, but it won't be of great practical help in the first and second quarters.

That's the consensus of producers and consumers queried by STEEL. The above figures show that little free steel, copper and aluminum can be available unless far greater percentage than usual of the CMP tickets are not cashed.

Educated Guesses—Last week government planners guesstimated that steel available for free distribution between now and June will total anywhere from 350,000 to 1.3 million tons, depending on how many tickets are not cashed.

They think 60 to 100 million pounds of aluminum could be in open end. (Producers think it's optimistic.) Planners make a guess about copper (for details

on the nonferrous reaction, see p. 159).

Although there won't be enough open-ended metals to satisfy much increase in demand, the action of Feb. 13, which modified controls until June 30, will permit an orderly move toward complete de-control after June 30 of everything but metal for the military. It will be a start toward re-establishing the old market pattern.

Here's How—Over the next four months the distribution pattern in steel will shape up this way: The first general availability of open-end steel should show up in the warehouse sector of distribution. Under Direction 20 to CMP Reg. 1, warehouses may sell without tickets or self-certification only the products which they are able to procure from mills' open-end production. Warehouses are the big-

Steel Imports Wither as U.S. Supply Eases

Japanese and European steel producers are in tight competition for the shrinking U. S. steel import market. The biggest attraction of foreign steel, availability, is fading

THE JAPANESE pose a definite threat to Europeans trying to sell their steel to the U. S. In fact, Japanese steel imports into the U. S. have outranked European shipments for the last three or four months. Most of the Asian metal goes into the West Coast area.

But, the entire shipments from both sources are so small currently that neither one is causing a ripple in the domestic market. And market conditions dictate a further decrease in imports following the trend which began more than a year ago (see the chart).

Attractive — Expanding U. S. steelmaking facilities, closer balance between supply and demand in this country and the price advantage of domestic steel—all contribute to minimize the lure of foreign

iron and steel products. The main attraction of foreign steel is its availability for fill-in or spot requirements. Even though both European and Japanese steel prices have been sliding downward since the steel strike last year (European prices went down about \$10 a ton on many products in fourth quarter, 1952), American manufacturers prefer to wait for domestic steel if they can get delivery in a reasonable period.

However, the possibility of further price rises on domestic steel and continuing shortages in local areas encourage importers. On the East Coast, plates and wire from Europe can be had within six weeks; cold-rolled sheets in six to eight weeks; merchant bars and deformed bars in six to eight weeks

and structural channels in about 16 weeks.

Underselling—At Providence, R. I., foreign pig iron, basic grade is being offered under the domestic price at \$58 per ton. More Swedish steel and rods are being bought for light, high quality applications, including music wire. That's true also of razor blade stock in which both Swedish and British (Sheffield) stock is moving at three to four cents a pound under domestic prices.

In the Pittsburgh area, deliveries are 45 to 60 days on Japanese plates, mostly in the 1020 clad grade. Recently a general offer was received by one importer in Pittsburgh from Belgian steel mills.

Handicapped Race — Japan has exported a large volume of steel casing and line pipe to the Gulf Coast market in the last two or three years. Delivery ranges from 4 to 6 months. That has helped the Japanese remain competitive with European suppliers although the Japanese must operate under a freight handicap—\$29 a ton from Japan to the Gulf and \$19 a ton freight from Europe to the Gulf.

On the West Coast, where the Japanese have made their deepest inroads into European traffic, they promise deliveries ranging from 30 days to 3 months depending on the product. Delivered prices of bars and plates are equivalent to Pacific Coast warehouse prices with duty paid, specialty items prices range 10 to 30 per cent above local warehouse costs. The import duty amounts to about 10 per cent.

Quality Spread—Japanese quality is generally good on sheets, very good on plates and poor on nails. Japan can and has produced AP pipe and casing with Moody's inspection, also Lloyd's ABS ship plates with mill certificates.

Both the Japanese, whose trade with the U. S. was recently running at annual rates of \$700 million in imports and \$200 million in exports, and the European countries whose mills in many cases are order-starved (see p. 61), have incentives for courting exports to the U. S. iron and steel markets. But only more sizable price rises of domestic steel or another prolonged steel shortage, will give them the opening they seek.

Source: U. S. Office of Business Economics. 1952 figures estimated by STEEL.

"I have been predicting capacity operations in the steel industry, and I so predict for this year"

AVERY C. ADAMS
President
Pittsburgh Steel Co.

FOR THE PAST ten years, I have been predicting capacity operations in the steel industry, and I predict for this year."

With that prognostication, Avery Adams, president of Pittsburgh Steel Co., Pittsburgh, opened a talk before the New York Society of Security Analysts in New York on Feb. 19. He's one of the first steel executives to predict capacity operations for the full year. Among the problems of the steel industry, Adams discussed the questions of excess capacity and breakeven points.

Growing Appetite—"There is no reason to assume that the demand for steel in the future will not bear the same relationship to such factors as Gross National Product, increases in population and increases in consumption of steel per capita as in the past, and if this holds true, then the expansion of the steel industry's capacity has been projected in a realistic manner," Adams said. The country's demand for steel, based on population growth and increased per capita consumption, has been equal to an additional 49 million ingot tons a year for a total of 110 million ingot tons a year over the period from 1919 to 1952. A further increase of 20 million ingot tons is estimated by 1952.

While breakeven points vary from month to month and are, therefore, "meaningless," Mr. Adams pointed out Pittsburgh Steel's

"breakeven point in 1952 was 55 per cent of capacity in terms of tonnage." In 1931, certain companies broke even at an operating rate of 38 per cent of capacity, he said. Despite that rise, Mr. Adams believes when the going gets tough the steel industry will find ways and means of cutting costs. "I think it is significant to observe at this point that no integrated steel company has ever gone through bankruptcy."

Growing Market—In regard to Pittsburgh Steel Co. itself, Mr. Adams said his company's expansion plans will enable it to increase finishing capacity by more than 80 per cent in the period from Jan. 1, 1951, to Jan. 1, 1954. Included in the expansion is a new continuous 66-inch hot and cold-rolled sheet and strip mill, to help Pittsburgh meet demand for what Mr. Adams described as "the fastest growing product market in the industry."

More Oil Country Goods in '53

Oil country tubular goods will be easier to obtain this year because of a 35 per cent increase of facilities over the 1950-51 period, says NPA's Iron & Steel Division. The expansion will make available 22 per cent more goods than in the former period.

The division released figures based on a survey of the industry. When compared with the 1,625,000 net tons of oil country tubu-

lar goods produced in strike-torn 1952, figures in the table below take on added significance.

	1953	1954	1955
	(Figures in net tons)		
Old mills	1,896,000	2,134,000	2,183,000
New mills	184,000	504,000	564,000
Conversion ...	125,000
TOTAL ...	2,215,000	2,638,000	2,747,000

By 1955, production will have increased over 1950-51 output by about 51 per cent.

Petroleum Administration for Defense officials are enthused over the report, claiming that such production should permit domestic oil drillers to sink in the neighborhood of 50,000 wells a year in 1954 and 1955. That would be 4000 wells a year over the 1952 total of 46,000 reported by *Steelways*, official magazine of American Iron & Steel Institute.

Inland To Get Canadian Ore?

Inland Steel Co., Chicago, soon may conclude an agreement with Steep Rock Iron Mines, Toronto, to import Canadian iron ore. Clarence B. Randall, Inland's president, made the preliminary announcement, although formal papers have not been signed yet.

Negotiations have been going on between the two companies for three years. Inland has sufficient ore resources "for a very long time," Mr. Randall said, but he believes Canada is a great potential source for future ore needs.

Osborn Mfg. Co.

INDUSTRIAL BRUSHES

Research finds new uses for brushes as production continues its steady gains. Manufacturers hope to surpass 1952 sales of \$60 million

INDUSTRIAL BRUSHES are sweeping to high production levels. New uses and developments made brushes for industry a \$60 million business in 1952.

Wider applications of brushes contributed to sales of more than \$55 million in 1951, \$49 million in 1950, as compared with \$42 million in 1947. Steady increases in 1952 encourage industry members who generally expect high sales this year. Most manufacturers say they can handle more orders, however.

Equal Uses—Industrial brushes are divided about evenly in volume between power-driven brushes for production uses, brushes for paint and varnish and for maintenance. The proportion for production is steadily rising. Metalworking's expansion brings with it an increased demand for maintenance and painting brushes.

Power brushes for production contain large quantities of steel wire. Alloy wires, such as brass and stainless steel, are used in brushes for special applications. Metalworking industries are the leading users of power brushes, accounting for about 30 per cent of total volume. These brushes are used for removing burrs and sharp

edges, breaking corners and forming radii, removing scratches and tool marks, cleaning, polishing, removing paint and varnish and smoothing rusted and pitted surfaces. Among special uses mentioned by Fuller Brush Co., Hartford, Conn., are cleaning tin plate before coating and scrubbing and cleaning hot-rolled flat steel after pickling.

Brush Material—Aside from metal, brushes may contain bristle, fiber or hair. Natural bristle, from hogs, is in short supply as imports from China and Russia, the largest suppliers, have been cut off. Heavy duty brushes used to remove burrs from metal parts are made of fibers such as palmetto, bahia and tampico. Brushes for painting and varnishing have soft bristles of animal hair.

The best news in the brush industry is the ever-increasing uses of brushes by such heavy customers as the following industries: Aircraft, automotive, farm equipment manufacture and rubber goods. A Cleveland firm, Herold Mfg. Co., reports new developments such as wire buffing of gear teeth to take the place of sand blasting. Blasting took more time and was less healthful for the worker. Recently

welding fabrications are brushed to remove excess oxide and to improve the metal's appearance.

New Uses—Growing in importance are stainless steel wire brushes where metalworking shops are fabricating that metal. Research has developed brushes for use in electronic equipment, while brushes with soft bristles are coming into increased popularity for buffing, polishing and finishing.

A major problem for brush manufacturers until recently has been obtaining wire and tubing for power brush cores. Supplies are more plentiful now, except for natural bristles for paint brushes.

Complicated Operation—An industry member, whose company makes 5000 types of brushes, pointed out a difficulty manufacturers face. There are so many applications of brushes that potential customers aren't familiar with all uses. Alert to this problem, leading companies such as Osborn Mfg. Co., Cleveland, are spending much time and money educating the public to the many possibilities of industrial brushes.

Hydropress Builds New Mill

A new type rolling mill for fabricating tapered aluminum alloy plates and sheets, such as those required for latest model military and naval aircraft, is being designed and built by Hydropress Inc., New York. The 145-inch four

h rolling mill will permit hot or d-rolling of aluminum alloy ets and plates from 0.032-inch 3.0-inch thickness. Operation is eduled for late this year.

FA Reports Coke Progress

Industry is making progress toward meeting defense mobilization needs for coke and metallurgical coal, the Defense Solid Fuels Administration reports, but much new construction needed to meet the expansion goal remains to be completed. To prevent a coke shortage, DSFA is working to carry out the largest coke oven construction program on record. A net gain of 3,468,000 tons in annual coking capacity was made in fiscal 1952, according to DSFA, which predicts a rapid increase in demand for coke in fiscal 1953. During fiscal 1952, certificates of necessity for tax write-offs of essential coal and coke facilities were certified for 88 projects costing about \$345 million. DSFA authorized and distributed controlled materials for 186 coal mine construction projects costing about \$59 million during the same period.

Powder Metallurgy Expansion

American Brake Shoe Co., New York, will diversify its manufacture of powder metallurgy products. Four years of research preceded the company's entrance into that field. First products marketed were friction materials for clutch parts. To carry out increased production, American Brake Shoe installed new production facilities in Hillburn, N. Y., plant. The expansion will double present capacity.

Ford Buys California Site

Ford Motor Co.'s preparations for an assembly plant at San Jose, Calif., are rapidly taking shape. The company purchased a 160-acre site for the plant, to cost between \$5 million and \$50 million.

Capacity will be about 150,000 cars and trucks annually, to be distributed to 11 western states. Manufacturing space alone will occupy 1 million square feet. Officials say construction will start immediately.

Industrial Sales Growth Varies Widely

Makers of electrical equipment and autos do better than average, but steel and nonferrous producers slip below the norm. Federal controls cause some inequality

ELECTRICAL equipment manufacturers and auto producers had above-average gross revenue increases from 1941 to 1951, but the gross sales increase of iron and steel and nonferrous companies was below the average rise.

Those are among the conclusions of Fact Finders Associates Inc., a New York research firm, which surveyed 13 industries. The research is based on conclusions from tax payments and corporate revenue of 155 companies in the 13 industries (see the accompanying tabulation).

At the Top—Topping the list in growth was common-carrier trucking which increased gross revenues 408.75 per cent, more than three times that of the iron and steel industry. Truckers' taxes in 1951 equaled only 6.83 per cent of revenue received.

The favored position of trucking relates to the fact that trucks have been assisted in their growth through use of public highways. "Because of public contributions to

the costs of streets and roads it uses, trucking must be considered the only industry among those studied which does not finance its plant," Fact Finders Associates declare.

At the Bottom—Three industries—railroads with 97.5 per cent, public utilities with 96.54 per cent and nonferrous metals with 93.19 per cent—had gross revenue increases of less than 100 per cent for the surveyed period. Fact Finders attributes this to "excessive government regulation and controls."

"The railroads and public utilities," it reports, "have not had as much opportunity as other businesses to increase their sales by expansion of plant facilities, nor have they had as much chance to adjust prices to meet inflated costs, because rates are under federal regulation. Nonferrous metals, such as copper and nickel, are largely imported, and both their importation and their domestic production are under government control."

	INDUSTRIES	Gross Revenue Increase	Tax % of 1951 Gross Revenue	Sales or Gross Revenue in millions of dollars	
		1941-1951		1941	1951
ABOVE AVERAGE	Common-Carrier Trucking (23 companies)	408.75 %	6.83 %	\$ 73	\$ 370
	Electrical Equipment (3 companies)	240.42	15.46	1058	3600
	Miscellaneous Mfg. (24 companies)	229.79	12.76	1116	3681
	Rubber & Tire Mfg. (7 companies)	218.85	14.58	1197	3817
	Auto & Truck Mfg. (4 companies)	205.09	13.48	3508	10,702
	Communications (5 companies)	180.97	17.25	1299	3649
	Chemical Products (5 companies)	172.63	16.78	810	2209
	Food Products (9 companies)	161.10	3.04	2831	7391

Average Gross Revenue Increase		155 %			
BELOW AVERAGE	Retail Trade (9 companies)	142.83	5.30	3502	8503
	Iron & Steel (8 companies)	119.35	12.98	3776	8283

	Public Utilities (25 companies)	96.54	21.81	1352	2656
	Non-ferrous Metals (5 companies)	93.19	16.94	572	1104

The SS *Evanthia* takes on its first load of ore as . . .

Kaiser Opens Jamaica Bauxite Facilities

BAUXITE from the \$12-million Jamaican mining operations of Kaiser Aluminum & Chemical Corp. is now being used in the company's processing plant in Baton Rouge, La. The SS *Evanthia* took on a 10,000-ton load of ore at Port Kaiser, Jamaica, on Feb. 11 to mark the formal opening.

One of the knottiest problems to solve to make the opening a reality was getting the ore from the initial mining areas to the port, only 13 miles away. The southwest coast of Jamaica is fringed by a 500-foot limestone cliff laced with faults caused by earthquakes. Engineers of Kaiser Engineers division of Henry J. Kaiser Co. decided on a standard gage railroad. About 425 tons of dynamite were used in excavating 600,000 cubic yards of rock for the road bed.

Other Facilities — The Jamaica project also includes a 995-foot pier, ore handling equipment and drying and storage facilities at Little Pedro Point. Annual capacity will be 2 million tons of bauxite.

Kaiser Aluminum & Chemical has rights to 19,000 acres of bauxite on Jamaica, enough to supply its needs for about 50 years. Formerly, the company used ore from South America.

Costly—The new ore is enough different from the old to necessitate a \$23-million expansion and re-

modeling project at Baton Rouge. That increased the plant's alumina capacity to about 800,000 tons a year. Kaiser's Chalmette, La., and Mead and Tacoma, Wash., primary aluminum plants get their alumina supply from Baton Rouge.

When the over-all expansion program is completed, the cost will be about \$200 million and Kaiser Aluminum & Chemical's annual aluminum capacity will be more than 800 million pounds.

Contract Spurs Copper Mining

About 230 million pounds of copper will be recovered from an undeveloped deposit of low-grade ore in the Globe-Miami mining district of Arizona as a result of an agreement announced by the Defense Materials Procurement Agency. Miami Copper Co., at its Miami, Ariz., mines, will produce refined copper at a price of 27.35 cents a pound.

Development of a new ore bed will cost Miami \$3 million. Production should be underway in the first half of 1955, and the mines are expected to yield considerable molybdenum aside from the copper. The contract runs to June 30, 1962, but Miami reserves the right to cancel if its project loses money and the losses reach a stipulated point.

Aluminum from Abroad

NPA decision and promise of 60-day delivery spurs imports of aluminum mill products

THE PROMISE of 60-day delivery on imported aluminum mill products at no price premium is proving attractive to a number of U. S. fabricators and warehouses. Because orders placed with American mills carry a third quarter delivery tag for most products, an estimated 2000 tons of these products, principally sheet and coils, are imported monthly.

Sellers absorb tariffs varying from 3 cents a pound on sheet to 22.5 per cent on forgings. Great Britain is the principal exporter.

NPA Ruling — NPA's decision that imported material need not be deducted from CMP allotments furnished the incentive to seek supplies abroad.

Chief importing companies representing mills abroad indicate that flat sheet and coils are the chief tonnage items in demand.

Estimate Imports — Aluminum Import Corp., New York, distributor for the Aluminium Ltd. group, says sales of semi-fabricated products here over the past six months total about 10 million pounds. Delivery runs from 8 to 14 weeks and chief products sold are sheet, rod and some forgings for aviation use.

Aluminum Import, careful to point out that its interest in the American market is as an independent ingot supplier, stresses that it's only helping out customers on a spot basis. It believes the import market will dry up when U. S. mills catch up with backlogs.

Continuing Competition — While some firms regard the import boom as temporary, others feel they can meet U. S. prices on a continuing basis. One of the latter is E. Tanager Inc., New York, representing an English and an Italian company.

Canada Changes Alcoa's Plans

Aluminum Co. of America's proposed Taiya, Alaska, aluminum plant may come to life in a different manner than expected, with Canada supplying all electric power to the company rather than allowing Alcoa to utilize Yukon river water independently.

College Grads at Premium

Fewer seniors and more jobs mean that an already big problem will get even bigger

COLLEGE graduates will draw a premium price on the industrial market in 1953, if for no other reason than they are hard to find. Add to that the fact that wage controls have been removed, and you have the setting for a mad scramble on the college campuses next May and June.

A survey by the National Industrial Conference Board indicates that fewer men students will be graduated from American colleges in 1953 than in 1952. But at the same time, officials of 195 leading companies surveyed stated they will want more degreed men to fill their job openings. Last year, the average manufacturing company hired 6 graduates; this year that same company wants 70.

Not Available—But that many men are not available. In addition to fewer students, it is estimated that 25 per cent of the male seniors have not completed their tour of military duty. To make the situation even more acute, more companies than ever are getting into the race for the campus-bred man. The only encouraging aspect of the male shortage is that some eligible men will be released from armed services. Some of them were recruited two or three years ago and have business experience.

Price Tag—There is no doubt about the value of the college degree anymore. This year, the price tag in a manufacturing concern will range from a lofty monthly average of \$488 for a Ph.D. down to a respectable \$308 for a regular bachelor's degree. Engineers, who will be the most sought after of all, will draw an average of \$334 a month. Nonmanufacturing salaries will be slightly lower.

In order to get what they want, some companies are hiring 1953's graduates before they ever leave the halls of ivy. Others withhold a definite offer until the prospective employee has a chance to see the company facilities and some of the executives. But the report shows that 90 per cent of those surveyed are holding to established methods

Deep Freeze Stores Airplane Parts

Meat and vegetables have no monopoly on the use of deep freeze boxes, as this picture at Lockheed Aircraft Corp., Burbank, Calif., shows. The 40x12x10½ box is used to preserve airplane parts between steps in their manufacture. It can cool 2500 pounds of aluminum from room temperature to minus 20° F within two hours. Quick freezing delays age hardening after heat treating processes

of careful selection, despite the pressure to do otherwise.

Sans Pessimism—Not to be dismayed by all this, most of the reporting companies feel that by increasing their efforts, they can obtain the number they need. There isn't exactly optimism about the situation, but neither is there too much pessimism.

Better Balance in Labor Supply

Labor supply in January was in better balance and job opportunities more widely distributed than a year ago, says Secretary of Labor Martin P. Durkin. That's based on a survey by the Bureau of Employment Security and state employment bureaus in 182 major labor areas of the country.

Results of the survey showed 4 areas with labor shortages; 79 with balanced labor supply, compared with 51 a year ago; 81 with moderate labor surpluses, compared with 100 a year ago; and 18 with substantial labor surpluses, fewer than at any time since March, 1952.

Manufacturing employers in 108 of the 182 major areas surveyed predicted a continuing rise in need for workers to March of this year. In about half of these areas, only slight gains were anticipated.

Decontrol Accelerates

The Office of Price Stabilization took the price lid off thousands of more products last week

OPS put out seven orders decontrolling prices on thousands of products on Feb. 18. Of primary interest to metalworking executives are Amendment 41 to Regulation 9 and Amendment 16 to Revision 1 of GOR 5, both effective Feb. 18.

Items decontrolled by those actions include:

Heavy machinery, such as construction machinery and equipment; certain other machinery and equipment including locomotives, railroad cars, mine cars; materials handling equipment; elevators, escalators; mining, quarrying and oil field machinery and equipment; cotton ginning machinery; food products machinery; ore crushing and concentrating machinery; industrial and laboratory furnaces and ovens, except coke ovens; rolling mill machinery; farm machinery and equipment and textile machinery.

Automotive equipment, like fire trucks, hearses, ambulances, trailers, motorcycles, motor scooters

NEA

Gets Into the Act

Joseph Freehill, a little-known official in Washington until he was made price stabilizer, got into the act in a big way when he started carrying out administration orders to bring an orderly end to price controls by Apr. 30

but not motor-driven bicycles nor passenger automobiles.

Hand tools.

Business machine equipment and accessories; counters and computers.

Refractory products and non-metallic building material.

Lumber and wood products; coal and all other solid fuels and coal chemicals.

Manufacturers' sales prices were also freed on thousands of consumer items, previously decontrolled at the wholesale and retail levels, such as housewares, radio and TV parts, small electrical appliances, power lawn mowers, but not refrigerators, home and farm freezers, dishwashers, ranges, washers, dryers, ironers, food waste disposers or water heaters.

Industrial and commercial services were freed, except those involved in the production of commodities remaining under price control.

All transportation services were decontrolled including rental of automotive and other transportation equipment; warehousing, storage and dock and terminal services.

CHECKLIST ON CONTROLS

Materials Order

BRASS MILL PRODUCTS—Amendment of Feb. 16, 1953, of NPA Order M-82 permits distributors of brass mill products to place orders for replacement of inventory as soon as deliveries are made by the distributors rather than waiting until the succeeding calendar month to place such orders. It was effective Feb. 16.

Controlled Materials Plan

CONVERSION STEEL—Direction 19 to CMP Regulation 1 and Direction 7 to CMP Regulation 6, both issued and effective Feb. 12, 1953, extend through second quarter, 1953, authorization to purchase carbon conversion steel on an ex-allotment basis by manufacturers of Class A and B products containing steel.

UNRATED ORDERS—Direction 20 to CMP Regulation 1 and Direction 10 to CMP Regulation 6, both issued and effective Feb. 16, 1953, permit controlled materials producers to accept unrated orders for controlled materials after the beginning of lead time, calling for delivery after February, 1953.

Price Regulations

DECONTROL—Effective Feb. 13, 1953, the Office of Price Stabilization issued a number of communications decontrolling many items affecting the metalworking industry. Included are: All rubber products; all scrap and secondary metals; castings and forgings; construction services; rentals of most industrial machinery and equipment; prefabricated housing; lead, zinc, tin and most minor metals and minerals; paints, varnishes and lacquers; iron ore; petroleum, gas and products, including lubricating oils; collapsible tubes; and metal cap closures. Items decontrolled effective Feb. 18 include: Coal and all other solid fuels; commercial and industrial services; transportation and related services; manufacturer's sale of thousands of consumer items such as housewares and radio and TV parts; miscellaneous consumer durables such as business machines, equipment and accessories; nonmetallic building materials; refractory products; farm machinery and equipment; certain automotive equipment; construction and certain other machinery and equipment;

and industrial, scientific and technical glass products. Businesses affected by these orders are required to keep available for inspection whatever records were required by the regulations.

IRON, STEEL PRODUCTS—Amendment 5 of Supplementary Regulation, 100 of General Ceiling Price Regulation, issued and effective Feb. 12, 1953, gives producers of iron and steel products the option of rounding their ceiling base prices and extras and deductions expressed in dollars and cents per unit rather than rounding total prices.

PRIMARY NICKEL PRODUCTS—Amendment 1 of Supplementary Regulation 33 of General Ceiling Price Regulation, issued and effective Feb. 13, 1953, permits all sellers of primary nickel products to increase their ceiling prices 3.5 cents per pound.

BERYLLIUM COPPER BASE ALLOY—Supplementary Regulation 133 of General Ceiling Price Regulation, issued and effective Feb. 13, 1953, authorized a ceiling price increase for producers of beryllium copper master alloy. It amounts to about 11 per cent over the price established under GCPR.

RAIL, TRACK ACCESSORIES—Amendment 1 of CPR 186, issued and effective Feb. 16, 1953, postpones indefinitely the effective date of the regulation, which covers sales of relay and used track accessories.

Appointments in Washington

Dr. James Bliss Austin, director of research and chief of United States Steel Corp.'s research laboratory at Kearny, N. J., was appointed chairman of the Committee on Chemical Warfare of the Research & Development Board, Department of Defense.

Ralph S. Trigg, formerly the acting administrator of the Defense Production Administration, was named assistant director for production of the Office of Defense Mobilization.

James F. Brownlee, a general partner of J. H. Whitney & Co., New York was appointed as a consultant on economic controls for the Office of Defense Mobilization.

Brig. Gen. Bernard L. Robinson, recently appointed Army Assistant Chief of Engineers, will serve also as chairman of the Board of Engineers and Rivers and Harbors.

SELECTED DEFENSE CONTRACTS IN EXCESS OF \$100,000

How Industry Can Be A Better Neighbor

UNDER PRESSURE of defense orders, a midwest forging company scheduled a third shift at night. Within a week the plant had received nine telephone calls, three threatening letters and four delegations of irate citizens protesting the noise when the people in the neighborhood were trying in vain to sleep.

Realizing that the work had to be done, the company president ignored the letters, had the sales manager cursorily explain to the protesting delegations and made it clear to his secretary that he would take no more phone calls from anyone suspected of having a gripe.

Within a fortnight the company found itself the subject of a series

of newspaper articles about industrial nuisances. Threats were made in the city council to rezone the district. The firm finally realized that action was necessary.

It hired acoustical engineers to see what could be done about the noise. It hired trained public relations men to see what could be done about the community's attitude toward the plant.

The public relations men had the answer. A plant tour was scheduled to show the community that the firm was working on defense goods. Showing the nature of its operations explained to people who had thought the plant was wantonly noisy just what was causing the noise. Finally, showing what the

acoustical engineers were doing at the company's expense to help cut down the noise in every way possible clinched the case. The neighbors stopped complaining about the plant.

That company managed to repair its community reputation. A dramatic situation forced it to. Maybe your reputation is just gradually eroding away without your realizing it. Do you know the components of good public relations? Do you know how to go about setting up a program to get good relations? The boxed portions on the next seven pages can get you started. If you're already started, the checklists can help you determine if you're doing a good job.

Sell the Program

If you already have a public relations department, better check to see that it conforms to these basic practices. If you haven't one, here's how to get started.

Establish policy. Base your whole approach to public relations on the knowledge that your company exists through service to its customers and to the community. Service with its counterpart, sincerity, constitutes the underlying orientation that must support your public relations program.

Select a policy-level executive to assume responsibility for your public relations program and to handle requests for information from outsiders.

Determine how people feel about your plant through unsigned questionnaires and interviews with community leaders. Encourage criticism to find out how you really stand.

With this knowledge of what your special job is, decide how much money is warranted and where your most important work lies.

Determine the best approach to the job with the money available. Big corporations each spend millions. Your job may require only a couple of hundred dollars.

You may wish to call in a public relations firm, particularly if you have a heavy attitude-repair job to do. Often your public relations can be best handled by a permanent employee or department, kept on the right track by occasional outside counsel.

A Matter of Reputation

Your reputation is important to the community. But the reputation of the thousands of plants and the thousands of communities throughout the nation is the reputation of industry—the reputation of free enterprise.

No stranger to "selling" free enterprise is management. It is estimated that the free enterprise selling job accounts for over \$100 million of industry's ad budget annually, not to mention an unknown but sizable amount of its employee relations expenditures. The theme has been hawked in every medium and mode the modern selling world can devise. But there are serious doubts as to whether the word is getting through.

"We of the industrial and business world deceive ourselves that we can 'make friends and influence people' through such things as paid newspaper advertising, pamphlets and billboards," says Standard Oil of New Jersey's Frank Abram. "Some of that may help under certain conditions, but when it becomes the main channel of effort, I think it is almost an insult to the intelligence of the average reader."

Paul Garrett, General Motors vice president, puts it another way. "Public relations must start not with what people ought to think, but with what they actually do think. . . . The most obvious lesson any company can learn, and seemingly the most difficult, is that good relations outside grow from good relations inside. If there is any secret to success in building good public relations, it is that you must begin at home and work from the inside out. Begin in the plant if you want to be well thought of in the plant community. Begin in the plant community if you want to be well thought of over the nation."

"Businesses—big and small alike—must plan their course mindful that their existence is of the consumer, by the consumer and for the consumer."

That is the heart of forward-looking public relations: If you want to be known as a good neighbor, be one. Communications fences must be torn down between your plant and the community. People

Do Your Part

Remember that definite identification with small specific groups in the community is most significant. Small company support of large causes can be lost in the shuffle.

Has your plant given tangible evidence of its desire to boost and build the community?

Does your plant give active support to welfare drives?

Does your plant sponsor activities in the community?

Are your personnel active leaders in civic groups in the community?

Junior Achievement of San Francisco Inc.

beve what they see or what they hear from friends, but the bombardment of advertising has taught them to suspect what they hear in mass communication media. Why would management promote the free enterprise system in the newspaper, they ask, if what the union men tell us in person is not true?

Your New Public Relations

Republic Steel Corp.'s Canton, O., plant when a disgruntled worker was told to hurry, he snapped back: "Why should I break myself out for Republic? They make \$75 out of every billet of steel and I get 75 cents." But his foreman, Chris Cutropia, was alarmed by classes in basic economics. He took the worker aside and convinced the griper that the company would be lucky to make 75 cents a billet. Reporting the incident to his superiors, Foreman Cutropia added, "Three months ago I couldn't have been able to say anything." That's a working introduction to a plan to sell free enterprise that companies like Republic Steel Corp., Clevite Corp., Weirton Steel Co., General Electric Co., Chrysler Corp. and others are finding really pays off.

Courses teaching foremen and workers how to read a company balance sheet, how company income is distributed and the basic facts of our economic system have grown ten-fold since 1945 and they're increasing rapidly. Their popularity with the workers is attested by the fact that attendance seldom falls below 90 per cent though the courses are voluntary.

Worker awareness of costs contributes directly to savings, say many firms with the programs. But from the community relations standpoint, most significant is the fact that workers gain an understanding of the way business works and tell their friends what they know. That's the kind of free enterprise "selling" that really works.

Clevite Corp., Cleveland, also has added an adjunct to its economic education program that other firms not doing so might well follow. Each year every employee is provided with a wallet-size card containing such company statistics as wages and salaries, sales, profits and dividends. The cards are highly popular and are frequently referred to in discussions with family and friends. A bar-stool argument over corporation wealth is quickly settled when the facts are

at hand. Most important of all, the company makes it quite clear that it has nothing to hide from its employees.

Getting the Leaders

But that's only part of the way the word is being spread. Modern public relations is aiming most carefully at the thought leaders in the community—expending its ammunition where it will do the most good. Since the people in the accompanying list mold the thinking of the people in their communities, many firms are putting them on a regular mailing list of information about the plant and its economic and social role in the community. These releases are designed to keep the thought-leaders informed. Their impact isn't weakened through commercialism and corporate-egoism.

Speakers' bureaus of companies like American Steel & Wire Division, U. S. Steel Corp., are also doing a fine job of spreading information about subjects of general interest with a minimum company slant. Lists of the speakers and their subjects are sent to civic clubs and other community organizations. The topics are timely and

Chevrolet

Keep a Clean House

Presenting a good appearance is as important to your community status as to customers' opinions of you. A slummish plant cannot be a good neighbor.

Have you taken steps to eliminate so far as possible nuisances like smoke, odors and careless disposition of waste material?

Are scrap or stock piles enclosed to sustain the good appearance of the plant and prevent injury to children who might be playing in the area?

Could your plant be landscaped to present a more pleasing appearance?

How long ago was your plant building cleaned or painted? Would a coat of paint or a slight modernization make it a stronger asset to the appearance of the community?

handled by company men in the field. Accountants can talk about corporate finance or the implications of the national debt. Sales officials talk about the economic role of the company's product, what it means to the listener. Corporate industrial relations men talk about the implications of labor moves. Such talks, if timely and objectively presented, give the

audience a favorable impression of management, the firm and the economic system it represents.

Public relations has been defined as "the mass production of favorable attitudes." Production of favorable attitudes means more than merely giving people information, though it may be friendly and sincere. Look at it this way: When it comes to evaluating your own

neighbors, you judge them not only by the friendly chats you have over the back fence, but by the things they do. You note the manner in which they care for their homes, the part they play in community life and their willingness to lend a helping hand.

Industry is known to most people in the community as "the buildings with the fences around them." Business, its structure and its problems must be humanized. They must become as much a part of the community as the storekeeper. Does anyone complain if the appliance dealer makes 10 per cent profit on his sales volume? No, because the people know and understand him and his operations. If he gets rich he's just a good businessman. But let industry make a profit of 10 per cent and many in the community are up in arms. Industry is a smoke-belching, noisy monster that steals the workingman's dollars to make a few bosses rich. The new stove of automobile at ever lower cost is somehow a product of the show room and not of the plant.

Invite the Public In

That's why the plant tour is outstandingly important to every plant. If you had a friend who never invited you out to his house, you'd suspect he wasn't really your friend or that he had something to hide. Your friends in the community feel the same way. They're curious about what goes on in your plant. Seven out of ten people say they'd like to see what goes on in plant in their community. Eight out of ten people who have been on a plant tour say they'd like to come back again next year. The back drop of equipment captures and holds the visitor's attention and enables management to give him facts about itself in a way he can not doubt—he has seen for himself.

Here are some points you'll want to consider in planning your plant tour:

Evaluate Purpose — Don't do all things for all people in on tour. Decide just what the tour should do and whom it should reach.

Publicize Widely — Newspaper, radio announcements and post

are effective in community tours. Invitations with r.s.v.p. closures serve well for smaller groups and aid in planning refreshments, number of guides required, etc. Directions for reaching the plant should be included.

Provide for Comfort—Make adequate arrangements for parking well in advance of the tour and mark clearly. Rest rooms should be clearly marked. Provision should be made for supervision of all children if necessary. Invited or not, they often arrive with their parents.

Plant Route — If possible, the route of the tour should follow a logical sequence of manufacturing, from simpler operations to more complex. Try to give the tour a logical meaning so that visitors can integrate what they learn. If there are danger areas, plan the route to by-pass them. Rope off stock or other things that might soil Sunday clothes.

Select Themes — Agree on a few main points that tell the story decided on. Keep them simple for a mass of detail confuses. Basic principles will stick.

Leave Themes Home — Repeat them at every appropriate opportunity along the route for repetition makes points stick, too. Tie your points into the tour in the guide's descriptions of equipment and through charts and signs where applicable.

Train Guides—Guides should understand thoroughly the purpose of the tour and the part they play in its success. The guide should have an easy, understandable and witty talk prepared for each part of the tour.

Keep It Short, Friendly — Two hours is a maximum for sustained interest in the tour itself.

Be Dramatic — Use exhibits to clarify and interpret the plant and its functions. Don't rely on questions or guides' talks to tell the whole story. Use raw materials, parts and finished products to explain where your company's money goes, how it benefits everyone liv-

General Motors

Welcome Your Neighbors

Not ballyhooing free enterprise, but letting people know you're a friendly neighbor makes the best case for industry.

Is the community well acquainted with the products and services which your plant provides?

Have you conducted community visitors through your plant within the last year to show them what your plant does, why you're in business?

Are special groups such as civic officials, community leaders and business men familiar with your plant and its role in the community?

Has anyone from your plant spoken before a civic group within the past three months?

Have you prepared slides or movies available to the community to tell the story of your plant and what it does for the community and for its customers?

ing in the community. Use sample advertisements and company customer activities to explain the import of your product.

Give Souvenir Booklets — Providing an attractive pamphlet covering the main points of the tour can serve two purposes: It will re-emphasize and fix in the visitor's mind the themes of the

tour; and it may bring out points he missed during the excitement of the tour itself. He can show the booklet to friends, too, so the tour will get points across to people who didn't actually take it.

Important to bear in mind are these facts: *Cost* can be from virtually nothing to several thousand dollars, but cost is no index of success. An inexpensive tour

Bethlehem Steel

Help People Know You

Just giving the facts about your company is more effective than defensively berating critics. Some free enterprise advertising is an insult to the intelligence of the reader and he feels it's meant "for the people who don't understand."

Do your employees receive a history of the company and a statement of its policies when they are hired?

Do workers really know their fringe benefits? Ask a few, you may be surprised.

Are employees provided with answers to questions outsiders may ask them about the company pertaining to profits, sales, expansion programs and company developments?

Do your employees know how your company income is divided?

Are the people in the community aware of cost reduction in finished products and the higher standard of living your way of manufacture provides them?

Are leading citizens in the community on your mailing list so they'll be kept informed on company developments?

that has a unified theme can be much more successful than a Hollywoodish hodge-podge. *Community* open houses should be held at least every two or three years. Small groups may wish to go through your plant as often as once a week, but once you are set up to give them they'll require little expense or effort. Production will go up during plant tours, not down. Workers can't resist the temptation to show off just a little for their audience.

Being a Good Neighbor

But the plant tour literally opens just one door on the way to becoming a good neighbor. People pass the exterior of your plant every day. Is it as attractive as you can make it? Does it look like a good neighbor's residence should? How about noise and smoke? Have you done everything possible to eliminate these nuisances?

Many plants feel if they don't ac-

tually get complaints from their neighbors they are doing an adequate public relations job. But selling industry and free enterprise requires more than a lack of complaints. You don't necessarily like neighbors you don't complain about. To be sold in the community, industry must be liked.

Beyond the Minimum

If you're saying, "All this advice doesn't apply to me," let us assure you it certainly does. Business men who merely sit in their offices and gripe about the way things are going don't help matters a whit. Winning respect takes positive action and the people must be shown what industry has to offer.

The "good neighbor" theme is mirrored in miniature by the program of G. E.'s Carboly Department, Detroit, when it built a new branch in Edmore, Mich. recently. First, store owners were asked how they felt about the new plant com-

Tell Your Story

Business language may not be dubbed an affectation by people in the community, but it's sure to confuse and weaken interest in what you're saying. Be sincere, be open and equally important, be understandable.

Do your statements to employees and the public avoid terms like—supply-demand imbalance, inventory adjustment, sales penetration, liquid assets, capital gains and unit cost reduction?

Are people told in dollars and cents what it means to each of them to have your plant as a producer and as a neighbor?

Do those from your company speak only before groups of other executives who already agree with the free enterprise message they're going to hear?

Are your talks illustrated with interesting and understandable charts?

Did you realize that most audiences feel they know just as much about free enterprise as you do? If you talk about people with socialistic ideas, you won't be talking to anyone.

Few Americans feel their ideas are socialistic.

Caterpillar Tractor

into the community. Their interest was aroused, they were made aware of its effect on their home town and they felt they were a part of getting the new plant to settle in the community.

Then post cards were sent to people in the community and nearby inquiring how they felt about the move and to make them part of the new plant's coming. As the plant was being built the people were not advised as to how it was progressing. When the plant was nearly ready to go into operation, its telling wages, benefits and other employment information were circulated in the local newspapers. The vast bulk of the employees were then hired from the Edmore area. When the plant had been in operation only a short time, an open house was held to show the whole community what was going on in the new factory. The turnout was overwhelming — 8 0 0 0 packed into the town of only 1500 population!

Now that the plant is in operation, a plant official speaks to civic groups often. Meetings of plant officials, civic leaders and business men are held regularly to discuss the effect of the plant on the community and also the effect of the community on the plant. As a result of such meetings, several building fronts have been repainted to make the town more attractive and a more adequate water supply has been instituted. An economics course is being sponsored by the plant in the high school. The plant is closed a week in the fall for the personnel to go deer hunting. The company buys local advertising, subscribes money to community drives and has provided a film library with a trained operator for civic groups.

In short, Carboly's Edmore story is the story of adaption to the community; a story of business as a good neighbor; a worthwhile part of community life.

Republic Steel Corp. felt that

economics as it's being taught in the colleges today lacked industry understanding. In collaboration with Case Institute of Technology, 50 professors of economics were gathered together to learn the points of view and operating problems of the men who have to meet payrolls. Guest experts lectured on such subjects as "Pension Programs and Capital Formation" and "The Position of Risk Capital." The lectures were followed by discussions in which the economics professors, the guest experts and management participated.

Then the economists went directly into industry. Here they traced a refrigerator back from the retail outlet through marketing, financing, advertising, production and finally to the raw materials. Executives of these 17 co-operating companies soon discovered that the professors had some sound ideas to offer management, while the economists began to get better insight into the pressures that surround

Every Firm Needs a Public Relations Program

- "Public relations" is a lot more than a ten-dollar phrase for publicity. It's everything your company says and does. Publicity is just the tool for letting people know about it.
- What your plant does is just as important as what your public relations program says it does. To be known as a good neighbor you must act the part.
- After the community develops a favorable attitude toward your plant, community relations must be continued. You can't turn helpfulness on and off as you feel you need it.
- Public relations programs can easily cost more than they're worth. A public relations program that is not backed up by sound action is just so much hollow noise.
- Sound public relations arouse people's curiosity about your plant. People become interested in the company's welfare and respect the facts you give them.
- Worker opinions about your company's income are altered by the facts. Be open with your employees. They'll respect you for it and tend to help you when help is needed.
- Plants not making consumer items need public relations too. They must make people understand what their product is for in selling their plant communitywise.
- Good public and community relations are easier to achieve in a small plant. Big plants have more money, but the friendly environment of a small plant is a natural for public relations. Capitalize on smallness by developing the family atmosphere.
- Efficient public relations helps information seekers to reach top management. Public relations people do not need to have all the answers. Outside callers respect the firm more if they can talk directly to the person in authority.
- Plants can grow without a public relations program, but with community support, the path is much less rocky.

management decisions which defy theory. Both groups benefited and a group of small manufacturers in Youngstown are pooling their efforts with a university there to conduct a similar program in the near future. Plants in your area can do it, too.

The summary of the professors who knew the purpose of the program, is particularly timely. They report:

"Spend more time in civic affairs and less in country clubs. Stop talking to yourselves. By and large, people are not suspicious of the mechanical workings of capitalism, but they worry about the motives of management. Being exclusive tends to compound this suspicion."

The Chance Is Yours

"Now or never. . . ." has bombarded management from the nation's editorial pages so heavily during the past 20 years that crisis is as regular as the morning newspaper — anticipated, acknowledged and used to wrap the daily garbage.

But with the election of Dwight D. Eisenhower, the first shouts of jubilation in victory were followed with the sobering realization that American business management holds the reins of its destiny. Editorial pages today are strangely quiet. Business is no longer on the outside looking in. It can no longer merely be against things. The role of critic is gone.

Henry Ford II, writing in the *Saturday Review* says, "This is an opportunity that we in business must not fail to meet. For years we have talked glibly of the superiority of the American way and of our ability, if given the chance to correct many of the evils which beset us and the other peoples of the world.

"We have asked for the chance to show what we can do. Now we have that chance."

The chance is yours. What the nation thinks of free enterprise is what it thinks of every plant in every community. Your neighbors are the people who vote. Your plant is what they know about free enterprise.

The time for action is now.

Building Up Knowledge for Pakistan

Mir Asad Ali, right, of the ministry of industries, Pakistan, studies an open-hearth furnace at Phoenix Iron & Steel Co., Phoenixville, Pa., a subsidiary of Union Steel Corp., New York. Dr. Ali is getting practical job training and technical knowledge to help him modernize the steel industry of Pakistan. Frederick Demaker, left, smelter foreman, explains the furnace operation to the visitor.

Steel Supply Nears Balance in Europe

Production facilities continue to grow in Europe but orders are becoming harder to get. Loss of exports to the U. S. market is one sore spot

HOW SOON will European steel supply meet demand? That question is being asked often by European industrialists and some experts there predict it will balance this summer or, at the latest, early next year.

A quick look around the major European steel producing countries brings up these facts:

Balance—British steel output in 1952 at 18,059,000 tons was high in history of the British steel industry. The country is rapidly nearing the point where it may feed itself with more than ample supplies to meet its domestic and export needs, according to the British Iron & Steel Federation.

In Germany, backlogs of rolling mills and steel plants, generally, are shrinking. Foundries are noting a large decline of incoming orders forcing shortening of working hours and in turn reducing orders for pig iron. Actual German steel production for 1952 was 14 million tons compared with

14.9 million tons the previous year.

Searching—Managers of Belgian and French steel plants are hurrying through Germany in order to place additional orders at any price. The Belgian steel industry is still busy, but it's only because of past orders. New orders are difficult to obtain.

Many western European steel mills are order-starved in the full meaning of the word. Complicating the situation is the lack of activity in the U. S. import market and increased competition from American mills (for more on this, see the story on p. 46).

The whole condition casts a pall on the Schuman Plan (now called the Montanunion). The Montanunion aims at increasing production by stepping up steel capacities. But, gradually becoming the biggest nonpolitical question of the union is: Where are the markets to absorb the more-than-51-million tons of present steel output within the participating countries?

Subsidize U.S. Competitors?

The question of how far the U. S. should subsidize foreign countries whose manufacturers can compete in the American market at prices below that of domestic producers was raised by H. E. Robertson, executive vice president of the Cast Iron Soil Pipe Institute at the annual convention of the Illinois Master Plumbers Association in Chicago.

Mr. Robertson endorsed the need for continued foreign economic aid but cautioned: "Whatever is done will require an intelligent, workable program, because of possible disturbing effects on our economy."

He told how some foreign soil pipe manufacturers, whose countries received American economic assistance, sold their products here below our prevailing prices, while selling them in their own countries well above these same prices. "Furthermore," Mr. Robertson said, "they had to absorb the freight charges for their pipe sold in this country."

Attack on Trade Barriers

"Let's give our (foreign) friends a fair crack at the American market."

So said Henry Ford II, president of the Ford Motor Co., at the annual winter meeting of the Inland Daily Press Association in Chicago.

Mr. Ford hastened to add one point: "I am not urging a course of action which I feel would benefit others at our expense. . . I am convinced that a considerable growth in our foreign trade—imports as well as exports—would be a continuing shot in the arm for our whole economy."

To implement such a plan Mr. Ford suggests we should: Write a new law without loopholes encouraging the rapid elimination of all possible tariffs; abandon completely the quota system; abandon the Buy American Act; and enact a workable law for simplifying the custom procedures.

Referring to the growing sale of foreign cars in the U. S., Mr. Ford said: "Ford Motor Co. . . intends to meet foreign competition in the market place, not in the halls of the Tariff Commission. . . we ought to get rid of the 10 per cent tariff on cars at once."

GOVERNMENT OFFERS HAVE FEW TAKERS
... too many strings attached to appointments

Federal regulations prove severe to appointees from industry. The result is to discourage businessmen from filling government positions

UNLESS CONGRESS modifies the "conflict of interest" law, which prevents persons holding interests in a company from becoming officials of a department doing business with that company, it looks as though relatively few industrial leaders will be called into service of their country.

Financial Trimming — The financial sacrifices made by some Eisenhower appointees under this law do not encourage a yen for public service. Disregarding taxes they will have to pay as a result of divesting themselves of stock holdings, the four new Defense department heads are taking a terrible beating on income. For example, Defense Secretary Charles E. Wilson, who received \$600,000 a year from General Motors now gets \$22,500. His deputy, Roger M. Kyes, who drew almost \$300,000 as a GM vice president, now gets \$20,000 at the Pentagon.

If the case of Robert C. Sprague, reported in this column last week, proves a precedent, the Eisenhower administration will send to Congress no more nominations of business leaders who have interests in companies doing business

with the government. When Mr. Sprague was nominated as under-secretary of the Air Force, his company decided that during his tenure with the Air Force it would not enter into any contracts with that service. At the same time, Mr. Sprague said he did not wish to dispose of his stock in the company.

Approval Promised — Mr. Sprague was assured that his company's decision to refrain from doing business with the Air Force would make it possible for him to retain his stock and win Senate approval of his nomination.

But the White House, having had its fingers burned in previous cases, decided to take no chances of stirring up public criticism on appointments of businessmen and withdrew Mr. Sprague's nomination.

Cutting Federal Competition . .

Taking the lead in getting the government out of competition with private, tax-paying business, Rep. Fred E. Busbey (Rep., Ill.) introduced H. J. Res. 184.

This proposal would create a

commission of 21 representatives of private industry to look over the 80 federal agencies engaged in direct competition with private enterprise, including about 40 which carry on lending and credit activities. "More than \$12.5 billion in federal funds are invested in these lending activities, with additional commitments of more than \$9 billion," said Mr. Busbey.

The resolution is aimed particularly at the publicly-owned power plants which represent an investment of \$50 billion—more than twice that of all privately-owned utilities. But the resolution is all-inclusive; public housing, he said, constitutes unfair competition.

House action is paralleled by a Senate drive to put the Reconstruction Finance Corp. out of business by next Jan. 1.

To Discuss Grinding Methods .

An important meeting to acquaint government officials with recently developed alternate processes for grinding tungsten carbide cutting tools is to be held Mar. 6 in Washington.

The meeting will climax a long campaign to reduce our dependence on imported diamond bort. Seven alternate processes are available, three of which will be unveiled at this meeting. Attendance, aside from the government experts, will be limited to companies and individuals experimenting with the alternate grinding processes, as well as those experimenting with cavity erosion.

Presiding over the meeting will be Herbert Newman who, as conservation officer in the NPA Metalworking Equipment Division has had charge of the alternate grinding method drive. Work done to date not only assures less dependence on industrial diamond in the future but will lead to faster and cheaper metal removal.

Outstanding feature of the meeting will be a report by Prof. C. W. Boston, University of Michigan summarizing test findings of tungsten carbide cutting tool ground by the various alternate processes.

McKAY

ROLL FORMING
MACHINES FOR
PRODUCING SHAPES FROM FLAT STRIP.

McKAY Machine
to Make Every Section

REAR VIEW

STANDARD FEATURES

MICROMETER ADJUSTMENT. All pressure points on top shaft controlled by simple crank motion, through worm and gear reduction. Top shaft is ALWAYS PARALLEL. Micrometer dial furnishes visible check on roll pressures.

TYPICAL RUGGED McKAY CONSTRUCTION. Standardized units, choice of gearing, anti-friction bearings throughout, all gears between bearings, NOT OVERHUNG.

INTERCHANGEABLE GUIDING EQUIPMENT, easily adjusted, quickly removable.

MINIMUM CHANGEOVER TIME. All units engineered to allow complete roll change in shortest possible time.

LOW MAINTENANCE COST. All of the foregoing features, plus precision workmanship and up to the minute engineering, are a guarantee of low maintenance.

OPTIONAL FEATURES

BASE EXTENSION. Permits increasing the number of roll passes to meet future requirements, by the addition of standard housing units at a later date.

MOTOR DRIVEN COOLANT PUMP. Supplies flushing fluid to the rolls at each roll pass, and provides a rust preventative treatment to the formed strip. Tanks for fluid are built integral with the welded steel base.

Complete Steel Service* from One Source

This completely modern plant with latest type equipment for rolling strip and processing sheet and strip steel is your ideal source for:

- *Warehouse stocks in sheets, plates, coils, cut lengths... All tempers and finishes.
- *Steel strip in coils and cut lengths... restricted tolerances, all tempers and finishes.
- *Roller leveling, pickling, annealing, shearing, slitting and skin rolling.

PRODUCTION STEEL STRIP CORPORATION supplements our regular warehouse service with custom steel at mill prices. This new, 4-high, reversing type cold strip mill with its modern, electronically operated *fingertip* quality control affords unusual flexibility in supplying steel strip to your exact specifications. Thickness .025 to .125 in all tempers and either bright or satin finish, can be processed to your exact width in coil or cut lengths.

Small Hand Tools in Supply-Demand Balance

Tool kits bulge as skilled workmen buy more of their own small equipment. Few new models appear on the market as manufacturers standardize their lines to meet the growing demand

KILLED WORKERS may be hard to find in some areas of the land, but the hand tools with which they work are in good supply, and the way it looks they will continue to be readily available for quite some time.

This industry, which produces the wrenches, pliers, screw drivers, and other tools found in the skilled worker's tool kit, is thriving right along with the rest of the metalworking economy. In 1952, it shipped at the clip of about \$8.4 million a month. That was down slightly from the peak year of 1951, but still almost \$2 million a month over 1950 and more than \$1 million a month over 1949. And prospects are that 1953 will see another good year, with a decrease, many, of only slight proportions.

Individual Growth—Illustrative of the rapid growth of the industry is one large precision tool manufacturer who recalls that in the 35 years since World War I, his company has increased sales by about 100 per cent. Not all firms in the industry can show such a spectacular increase, but most have had comfortable growth.

Reasons for the big market in

hand tools are many. Of prime importance is the growing trend toward workers owning their own tools rather than using company-furnished equipment. The worker today has more money to buy his own tools than did the worker of a decade ago. He also takes greater pride in his tool kit.

Added Impetus—Another reason is that more men are becoming tool conscious, not only in the factory, but also in the home. Many of them learned how to handle tools while in the armed services, and they are continuing the skill on the family TV set, kitchen plumbing and automobile.

About 54 companies supply the needs of the hand tool market. That does not include such specialized equipment as micrometers, calipers and power tools. Some make complete lines, while others specialize. Most of the larger companies make their own components, but the smaller ones often depend on outside sources for such parts as gray iron castings, malleable iron castings, forgings and some of the rivets, bolts and nuts used in assembling.

Meeting the Demand—Although the demand for machinists' hand

tools has grown so fast in recent years, the industry has had little trouble in meeting the demand, says George P. Byrne, managing director of Service Tools Institute, New York. In a period of critical shortage of machine tools and metals, manufacturers increased capacity enough to avert what could have been a serious hand tool shortage.

One reason for that is manufacturing processes have not changed greatly in the past few years. The main operations are still heat treating, forging, punching, machining and assembling.

Standardization—Many producers purposely standardize their products in order to concentrate on meeting the increased demand rather than changing design or making new tools, which would take time and added equipment. That does not mean that the industry is standing still, however.

The metalworking world, especially electronic and aircraft industries, is constantly demanding more specialization, and tool manufacturers must modify their products or make new ones to meet this demand. In addition, the modern worker is more quality conscious in regard to his tools. The manufacturers must meet that quality or stand to lose some business.

But the first half of 1953 should see a brisk business in small tools. What happens after that depends on the general business climate.

Manganese Program Expands

Under an amendment of its Defense Materials Procurement Agency's contract, the Southwestern Engineering Co., Los Angeles, will expand its project aimed at developing an economical method of extracting manganese from low-grade domestic ores to include Aroostook manganese ores from Maine and so-called "wad" ores from Virginia and Arkansas.

Small Hand Tools

Average Monthly Shipments

1941	\$3,750,000
1944	7,500,000
1946	7,600,000
1947	7,800,000
1948	6,619,000
1949	5,368,000
1950	6,461,000
1951	8,674,000
1952	8,439,000

VERTICAL CHUCKING

Grinders BY BULLARD

BULLARD

Bullard presents a carefully engineered and developed Vertical Chucking Grinding Machine in a range of sizes to meet present day requirements for conveniently grinding the larger sizes of work.

Years of Study of field requirements for a truly accurate machine of this kind have produced this Vertical Chucking Grinding Machine now in operation at THE TIMKEN ROLLER BEARING COMPANY, Canton, Ohio.

It is designed and built with Bullard characteristic Vertical Turret Lathe ruggedness and rigidity, combined with the sensitivity of control and built in precision so essential for successful grinding results.

Precision, flexibility of control, safety design and productive efficiency place THIS LINE OF VERTICAL CHUCKING GRINDING MACHINES as an IMPORTANT item on your list for immediate investigation.

Write now for Delivery dates and complete information, ask for VG-6S.

THE BULLARD COMPANY
BRIDGEPORT 2, CONNECTICUT

Mirrors of Motordom

Now that nearly all engineering and styling features on 1953 cars have come to light, it's clear no revolution is occurring—with the exception of Studebaker styling

DETROIT

THE BUMPER-BEARING crop of 1953 autos is virtually out. Yet to hit the road are the Studebaker line, the Hudson Jet and the Nash Rambler. Material and labor troubles are to blame in two cases, with the troubles plaguing at least one of the new-bodied trio.

Promotion materials on Studebaker and the Hudson Jet are already on the scene, but last week the Jets numbered only somewhat over a thousand with production running about 20 an hour.

To Come—Yet to be heard from is the Nash Rambler which will be a miniature of the Pinin Farina styling on the other Nash models. Several truckloads of the little bascals have been seen in the Detroit environs, but Nash is saving its promotion wad as scheduled for a big surprise about Mar. 5.

The traditional "unexpectedly enthusiastic consumer response" routine is being recited by the automaker public relations people, but stylists and engineers admit there's not a lot to get unexpectedly enthusiastic about. Automakers will ride the waning demand for one more year with harder selling before they get down to shaking changes to rekindle the consumer urge.

Studebaker, the Exception—Generally conceded to be the strategic move is Studebaker's sports styling. When you stop to consider that the designs had to be frozen two years ago before the sports car vogue was barbershop conversation, Studebaker's anticipation of the trend was remarkable. Whether or not the family with kids and groceries will want one is the question rival stylists are waiting to have answered.

Among the big three, Chevrolet's Bel Air is probably top news, with Plymouth and Dodge styling a close second. Frankly aimed at invasion of a market", Bel Air

offers insurance that this will not be the year for Ford to regain sales leadership. Some feel that Ford decided this was not the year to challenge and will be putting its real offensive into 1954 lines.

Pontiac Problems—The Pontiac has an all-new body, but to the layman the distinguishing feature is the rear fender kick-up. That touch could probably have been added for a few hundred thousand dollars rather than the several million in a complete body rework.

Cadillac comes home full bore at 210 horsepower, winner in the annual horsepower derby. Lincoln is a close second with 205 hp in a somewhat lighter car. Chrysler, several notches back, avers that it is "not in any horsepower race" which many claim it started.

No Revolution—By and large 1953 has been just another year automotivewise. The gradual evolution of accessories becoming standard equipment continues with directional signals being offered by most automakers as standard on everything but their un-deluxe lines. Automatic transmission efficiency continues to increase with sales, and the no-shift accessory is now standard on many of this year's models.

Tinted glass has arrived in 1953. Every automaker offers the no-glare product and here's the dope if you're considering it: Plain glass reduces spectrum intensity to about 82-88 percent when it's clean. A little dirt will drop the figure lower in a hurry. Tinted glass cuts the spectrum intensity to about 72-76 per cent when it's clean. A figure of 70 per cent intensity is considered safe so the basic question seems to be a matter of taste. Some users report the commodity is particularly useful at night. Others prefer sun glasses which can be removed.

models for 1953. Prices are f.o.b. factory. Major equipment items are included so you can get an idea of what your dollar will buy, and a moment's computation will show you the list price is a far cry from the fully dressed vehicle. Then you'll have taxes.

Not included is air conditioning first perfected in 1937 and now available at \$594 on Oldsmobile, heavy Buicks, Cadillacs (\$619) and later this year on Chryslers (price unannounced). Nash reclining seats at \$18.45 and Studebaker's hill-holder at \$15.08 are other special accessories omitted as are power brakes and electric window lifts. Only the Chrysler Custom Imperial offers both as standard equipment, but they are available for some models of Buick, Cadillac, DeSoto, Mercury, Lincoln, and Packard. Additional cost for power brakes ranges from \$35.19 (Buick) to \$40 (Lincoln). Lincoln is also high with electric window lifts at \$165: DeSoto offers them at \$115.00, Cadillac at \$138.64, and Packard at \$153.

Think the old buggy'll run another year?

GET HIGH ALLOY PERFORMANCE WITH LOW ALLOY STEEL FOR GAS TURBINE PARTS

*"17-22-A"(S) gives maximum creep resistance up to 1000°F!
Saves critical alloys!*

Time-elongation creep curves at 900°F. show high creep resistance of "17-22-A" (S)

TO get high alloy performance at low cost in gas turbine parts that operate at temperatures not exceeding 1000°F., use low alloy Timken® "17-22-A" (S).

You save strategic alloys because "17-22-A" (S) contains less than 3% alloys.

Yet you get a steel that's been used successfully for 10 years in refinery and steam power applications where resistance to creep at high temperatures is essential. The graph above shows how "17-22-A" (S) retains its creep resistance under prolonged high temperature and stress.

In addition, "17-22-A" (S) resists heat checking and

thermal cracking. It's easy to machine and weld. It's readily workable up to 2300°F. Maximum high temperature properties can be developed by simple air cooling heat treatment, holding possible distortion to a minimum.

For complete information about "17-22-A" (S) and its companion analysis, "17-22-A", write for Technical Bulletin, Number 36. And for help with your high temperature problem, call upon our Technical Staff. The Timken Roller Bearing Company, Steel and Tube Division, Canton 6, Ohio. Cable address: "TIMROSCO".

The Business Trend

STEEL'S INDUSTRIAL PRODUCTION INDEX (1936-1939 100)

Metalworking companies can expect an orderly decontrol of materials through open-ending of the Controlled Materials Plan. Index inches up to former high level

BUSINESS ACTIVITY, now at a brisk momentum, may show more signs of genuine health as industry goes off its austere diet of raw materials. The nation's industries, unlike most human patients, often their own best doctors. A significant step toward a freer, wholesome economy may be the open-ending of the Controlled Materials Plan by the Office of Defense Mobilization. Any steel, copper and aluminum left after CMP allotments have been met may be sold to anyone. Previous CMP allotment tickets were needed to obtain any amounts of these raw materials.

Orderly Withdrawal—But open-ending of CMP doesn't necessarily mean that the government will ease material controls out the window immediately. Decontrol probably will occur in an orderly manner. Tickets already issued for second quarter must be honored before materials are sold on a first-come, first-served basis. Among the steel products which will continue in short supply are: large bars, heavy and wide plates, and hot-rolled and cold-rolled sheets.

The real significance of the open-

ending is that many manufacturers in the second half of 1953 will have to ferret out their own materials. Nevertheless, open-ending is a move toward making private industry the master of its own destiny once again.

Index Inches Up—Production is continuing at the high levels attained in mid-January. STEEL's industrial activity index in the week ended Feb. 14, after a slight decline a week earlier, edged up 4 points to the level attained two weeks earlier—228 per cent of the 1936-1939 average. Steel production rose 2 points to 99.5 per cent of capacity, while automotive output increased slightly more than 1000 units. Freight car loadings and electricity production in the week ended Feb. 14 remained virtually the same as a week earlier.

Corporate Dividends Vary...

While dividends paid in January by all manufacturers remained about the same as a year earlier, payments in the various metalworking industries were at sharp variance.

The Commerce department's Of-

fice of Business Economics reports that cash dividend payments by manufacturing corporations issuing public reports totaled \$170.5 million in January, compared with \$169.6 million in January, 1952. The iron and steel industry however paid \$9.9 million or 14 per cent less than a year earlier. Producers of nonferrous metals paid \$5.2 million, up 23 per cent from January, 1952. Nonelectrical machinery makers paid \$27.1 million, down 4 per cent. Electrical machinery makers paid \$25.8 million, virtually the same as a year earlier. The automotive industry lowered dividends 4 per cent to \$2.5 million. The transportation industry (including aircraft) raised their dividend payments in January 32 per cent to \$3.3 million.

Auto Output Blocked...

Scattered labor disputes are blocking the automotive industry's drive to surpass the high-point in 1952 production. Several weeks ago, manufacturers were a hair's breadth away from attaining this goal for U. S. passenger cars and trucks. In the final week of January, auto-truck production reached 141,317 assemblies, only 5337 units under the 1952 record set at the end of October, says *Ward's Automotive Reports*.

however, are declining under the level attained in the week ended Jan. 31. Total U. S. production of passenger cars and trucks in the first week in February numbered 137,732 units. This output was raised in the week ended Feb. 14 to 138,793 units, still a long way from the 146,654 weekly record for 1952.

Suppliers' strikes are the main reason for the downslide, although change-over problems trimmed output a bit. Only General Motors Corp. was left unscarred by a rash of production deterrents. Yet the cloud cast over production may lift as suddenly as it appeared.

Combined U. S. and Canadian auto-truck output in the week ended Feb. 14 totaled 148,911 units, up 2103 units from the previous week. In the comparable week of 1952, U. S. and Canadian manufacturers drove only 111,821 passenger cars and trucks off their assembly lines.

Freight Car Orders Drop ...

Production of freight cars is continuing to make steady upward progress and is far outpacing the rate of incoming orders. The Association of American Railroads and the American Railway Car Institute announced that production of new domestic freight cars in January totaled 7981 units, the highest monthly output since before the steel strike. Cars ordered in January dropped to 5536 units trimming the backlog to 77,414 freight cars. A year earlier, the industry backlog amounted to 120,251 cars.

Business Profits Lag ...

Profits are dropping off, despite the rise in production. That's the consensus of industrial buyers surveyed by the Purchasing Agents of Chicago. Since October, more purchasing agents have reported profit declines than have reported increases. Step-ups in production on the other hand, have been the rule since the end of the steel strike, according to the association's January survey.

Inventories continued to increase during January, but the upturn was gradual. Many buyers say they need larger inventories to

meet the demands of their greater production turnovers.

Unfilled orders, after taking a seasonal drop in January, bounced back to the levels attained in November. Deliveries started to speed up, reversing the downtrend in the second half of 1952. Prices in January moved upward, as only a few buyers were able to break down through the price level established last August.

In answer to a special question on the Controlled Materials Plan, 52 per cent of the buyers said they believed that CMP has helped to control inventories, while 48 per cent said "no".

Expenditures on new construction are expected to jump for manufacturers in the Chicago area. Total estimates of the surveyed buyers place new construction outlays at \$31 million, compared with \$24 million in 1952 and \$19 million spent on new plants in 1951.

Aluminum Shipments Rise . . .

Output of aluminum products is soaring in response to the needs of the aircraft industry. On the other hand the production of magnesium products continues on the downgrade.

The Bureau of the Census says that shipments of aluminum products in December reached 179 mil-

lion pounds, or 33 per cent above December, 1951. Cumulative shipments of 1924 million pounds during 1952 were 10 per cent over the 1951 total. Magnesium wrought products shipped in December totaled 1.4 million pounds, nearly 6 per cent under shipments a year earlier. In 1952, shipments totaled 18.4 million pounds, a 3 per cent decline from 1951.

Construction Awards High . . .

Construction awards in January continued to decline seasonally but were still far above January, 1952. Construction contract awards in the 37 states east of the Rockies in January totaled \$1076 million, 27 per cent under the previous month but 19 per cent more than in January, 1952, says F. W. Dodge Corp.

Trends Fore and Aft . . .

Dollar volume of department store sales in 1953 by Feb. 14 was 1 per cent over the same period in 1952. . . Factory shipments of farm pumps rose 8 per cent in dollar volume during 1952. . . Bank clearings in January were around 1 per cent over the same month in 1952. . . Electricity production in the central industrial region of the U. S. is nearly 10 per cent over a year ago.

Important Reasons
why **PHEOLL**
SCREWS • BOLTS • NUTS
Produce
More Profit
For You

MAINTAIN PEAK OUTPUT with Pheoll precision-made screws, bolts and nuts—they will speed your assembly work and improve product appearance.

INSURE PRODUCT PERFORMANCE with Pheoll quality screws, bolts and nuts—standardize on these dependable industrial fasteners.

HUGE MANUFACTURING FACILITIES assure rapid production of both standard and special fasteners.

SINGLE SOURCE OF SUPPLY for screws, bolts and nuts in different sizes, types and metals.

OVERNIGHT DELIVERY to principal cities from centrally-located Pheoll factory and warehouses.

FACTS ABOUT Pheoll YOU SHOULD KNOW

- One of the nation's leading producers of industrial fasteners.
- Pheoll products are widely used in part assembly when quality is of prime importance.
- Men who produce Pheoll industrial fasteners are highly trained and experienced craftsmen.
- All products are manufactured under rigid quality control standards.
- Constant product inspection from laboratory metal analysis, through production and final finish is your assurance of precision made, trouble-free screws, bolts and nuts.

SAVINGS STORIES

FASTEST THING IN FASTENINGS®

BENDIX Perfect Laundry Pair **"Cleans Up" with SPEED NUT Savings!**

For years, Bendix engineers have relied on SPEED NUTS to cut assembly costs and step up production schedules. That is why SPEED NUT brand fasteners were specified on the new "Perfect Pair" automatic washer and dryer units.

Here is a direct quotation from a recent Bendix report . . .
". . . because we design from the ground up with Tinnerman, we effect basic economies. These include lower production costs and greater efficiency that result in lower retail prices and reduced service costs for consumers. Thus, in our production, we consider Tinnerman products more basic than nuts and bolts."
Chances are your Tinnerman representative can turn your assembly problems into production savings. See him soon for details on the Fastening Analysis Service available for your products!

U-TYPE SPEED NUTS are self-retaining, snap in place over panel edges or center-panel locations; remain in bolt-receiving position for fast, easy assembly.

SPEED GRIP Nut Retainers snap in place by hand . . . no welding, clinching or staking. They reduce materials handling and are ideal for blind locations.

A copy of "SPEED NUT Savings Stories", an interesting booklet of typical Tinnerman savings to industry, is yours on request. Write: TINNERMAN PRODUCTS, INC., Box 6688, Dept. 12, Cleveland 1, Ohio. In Canada: Dominion Fasteners Ltd., Hamilton, Ontario. In Great Britain: Simmonds Aerocessories, Ltd., Treforest, Wales. In France: Aerocessoires Simmonds, S. Men of Industry

ROBERT W. JEFFERY
... gen. sales mgr. of Currier Co.

Robert W. Jeffery was appointed general sales manager, Currier Co., Oakland, Calif. He was formerly manager of infra-red sales for Fostoria Pressed Steel Corp.

E. J. Dalton was elected president of Yates-American Machine Co., Beloit, Wis., to succeed W. D. Johnson, resigned. Mr. Dalton continues as chairman of the board and chief executive officer. A. H. Woeckel, executive vice president, will be in charge of operations of Beloit plants.

John R. Cary was elected president, Browning Crane & Shovel Co., Cleveland, to succeed his father, Sheldon Cary, who held that position for 40 years and who is now chairman of the board. Other officers elected are D. H. Leuszler, vice president; C. F. Barry, treasurer, and J. F. Svoboda, secretary. Arthur S. Meyer, executive vice president, and George T. Stalley, assistant secretary and assistant treasurer, retired. In addition to the chairman and president, directors of the company are David J. Hopkins, Wallace H. Maerke, Sheldon Reynolds, C. F. Barry and Russell Olderman.

Harry E. McDonnell retired Feb. 1 as superintendent, coke plant and blast furnaces, at Weirton Steel Co., Weirton, W. Va.

GILFRY WARD
... heads American Manganese Steel Div.

Gilfry Ward was elected president and Joseph L. Mullin first vice president of American Manganese Steel Division, American Brake Shoe Co., New York. Mr. Ward joined the Amsco division in 1928. In 1938 he became vice president and in 1948 was placed in charge of sales. Mr. Mullin was formerly vice president in charge of operations for the division.

Rollin M. Russell was appointed executive engineer for the West Coast operations of Continental Aviation & Engineering Corp., subsidiary of Continental Motors Corp., Muskegon, Mich.

L. G. Knight, since 1945 district manager of purchases and traffic, also assistant treasurer of Bethlehem Pacific Coast Steel Corp., was appointed assistant to H. H. Fuller, president. Mr. Knight's headquarters will remain in Seattle, where he has been associated with steel production for 43 years. His assistants, Howard J. Lenihan and Herbert F. Price, assume charge of their respective departments, traffic and purchasing.

Chester E. Grigsby replaces Ralph D. Brizzolara, resigned, on the board of General Steel Castings Corp., Granite City, Ill. Mr. Grigsby is vice president of American Steel Foundries.

WILLIAM C. WILSON
... Mesta Machine sales manager

William C. Wilson was appointed sales manager, Mesta Machine Co., Pittsburgh. He has been with Mesta for the last 18 years.

Nelson C. George was appointed assistant chief metallurgist of the Gary, Ind., sheet and tin mill, United States Steel Corp. He has been associated with this plant since 1936, and since 1947 has been development metallurgist.

Harold E. Kleintop was appointed manager of wire product operations of Hewitt-Robins Inc., responsible for production and sales at the Philadelphia plant which was acquired about a year ago from Korb-Pettit Wire Fabrics & Iron Works Inc. Mr. Kleintop was vice president and chief engineer of the plant when it was sold to Hewitt-Robins.

S. S. Goodwin, manager of mines, New Jersey Zinc Co., was named a vice president with headquarters in New York. He will continue to be manager of mines.

Norman C. Halleck was appointed to the newly created post of transportation manager, Chicago district, U. S. Steel Corp., with headquarters in Kirk Yard, Gary, Ind. He is succeeded by Charles Iams Jr. as assistant general superintendent, Gary, Ind., Works, in

charge of cost control. Mr. Iams formerly was assistant to the general superintendent, Gary sheet and tin mill.

Robert Smith was appointed assistant vice president-sales, eastern area, for **Pittsburgh Screw & Bolt Corp.**, with headquarters in New York. **Samuel M. Sipe** was made manager of sales in the New York district succeeding Mr. Smith.

Robert E. Eirons was appointed plant metallurgist for the Massillon, O., plant of **Union Drawn Steel Division**, **Republic Steel Corp.** A member of the division for seven years, he has been a stainless steel metallurgist.

Fred L. Pritchard was appointed representative of the Cincinnati office of **Brown & Sharpe Mfg. Co.**, effective Apr. 1 when **Howard K. Jackson** will retire after 34 years' service with the company.

Claud S. Gordon Co., Chicago, appointed **Claud A. Gates** as its representative in New York city, northern New Jersey, Long Island, Westchester county, N. Y., and western Connecticut areas. He previously was vice president of **Wheelco Instruments Co.**

Scovill Mfg. Co., Waterbury, Conn., named **Edward F. Anderson** assistant to the vice president in charge of manufactured sales with headquarters in Waterbury. He formerly was in the New York office. Also named were **Hayden R. Hotchkiss**, New York, and **W. E. Ashwell**, Chicago, as regional sales managers for the company's line of **Gripper zippers**.

Russell Mfg. Co., Middletown, Conn., elected **Leo S. Sullivan** vice president in charge of the automotive and aero sales division, **Peter F. Madsen** vice president in charge of the belting sales division, **Bruce S. Williams** vice president in charge of material and production control, and **A. Paul Smith Jr.** secretary.

E. Allan Williford was promoted from vice president and general manager, **Link Aviation Inc.**, Binghamton, N. Y., to president of the firm. He succeeds **Edwin A. Link**, founder and board chairman. Mr. Link also becomes director of research and engineering.

WILLIAM G. FIENEMANN
... Worcester Pressed Steel sales post

Worcester Pressed Steel Co., Worcester, Mass., appointed **William G. Fienemann** assistant sales manager and **John E. King** assistant to the sales manager. Mr. Fienemann continues duties as product development manager. Mr. King is responsible for cold-rolled strip steel and cold-finished bar sales.

Turchan Follower Machine Co., Detroit, appointed **Gale S. Humes** general manager, **Otto C. Turchan** sales manager, and **Demeter Kiurski** chief engineer.

James W. Tweedy Jr., new executive vice president and general manager, **Redmond Co. Inc.**, Owosso, Mich., was placed in charge of all company operations. He advances from vice president in charge of induction motor sales.

Frank W. Jones was appointed general sales manager of **Bradford Machine Tool Co.**, Cincinnati. He will be in charge of both the machine tool and electric tool divisions. He has had many years of experience in the sales and service departments of Cincinnati **Bickford Tool Co.**

Harold E. Lee was appointed New York district sales manager of **Bridgeport Brass Co.**, Bridgeport, Conn., to succeed the late **A. G. Mohrman**.

Earl F. Oyster rejoined **SPO Inc.**, Cleveland, in the capacity of staff engineer. Mr. Oyster was one of the founders of the company in 1935. He began his career in the

JOHN E. KING
... Worcester Pressed Steel sales post

foundry industry over 40 years ago as a molding machine designer.

Edward E. Nagel retired as manager of the percussion division of **Chicago Pneumatic Tool Co.**, Utica, N. Y. **Alvin F. Roepnack** was appointed to the newly created position of manager of the entire Utica plant.

Harbison-Walker Refractories Co. appointed **Max W. Demler** as salesman in its Minneapolis sales office. He previously worked in various posts in the engineering, mining and technical sales departments at the home offices in Pittsburgh.

William T. Lake was elected controller, **Curtiss-Wright Corp.**, New York. He formerly served **Ford Motor Co.** as controller in its River Rouge plants.

Samuel A. Wenk was named to supervise nondestructive testing research at **Battelle Memorial Institute**, Columbus, O.

S. S. Moxley was promoted from vice president to executive vice president, **American Cast Iron Pipe Co.**, Birmingham.

John Billera was elected treasurer, **Pressed Steel Car Co. Inc.** His headquarters will be in the company's main offices in Chicago.

Devon W. Fryback was named sales manager of the eastern region for industrial division, **Minneapolis-Honeywell Regulator Co.**, Philadelphia. **O. B. Pyle Jr.** is industrial

OBITUARIES...

Jacob D. Cox, until the first of this year president of **Cleveland Twist Drill Co.**, Cleveland, died Feb. 15. He has been serving as chairman of the board.

Gustavus A. Axelson, 82, retired oil well equipment manufacturer, died Feb. 8 at his home in Los Angeles. He was head of **Axelson Mfg. Co.** until retirement in 1946.

Ralph B. Dimmick, 69, consulting metallurgist for **Armco Steel Corp.**, Middletown, O., died Feb. 12 at Deerfield Beach, Fla. During his career with Armco Mr. Dimmick held many positions in the metallurgical and research departments, and was works metallurgist at the Butler, Pa., plant from 1927 to 1949.

T. Harry Cochran, 76, pioneer Milwaukee metallurgist, died Feb. 9 at Pompano Beach, Fla. He founded **T. H. Cochran Laboratories** in Milwaukee about 50 years ago and still operated the inspection division of the firm.

Frank H. Gordon, 74, retired vice president, **Lukens Steel Co.**, Coatesville, Pa., died Feb. 10. He retired in 1948 after having served the concern for 53 years.

Bertram D. Quarrie, 73, former general manager of **Otis Steel Co.**, Cleveland, died Feb. 15. Associated with several firms in Cleveland in the early 1900s, he moved into the steel business with **American Steel & Wire Co.** as general superintendent, central furnace division. He later joined **Otis Steel** where he became general manager in 1924. In 1928 he joined **Oliver Iron & Steel Corp.** and was president until the early '30s.

Herman F. Kelschenbach, 87, former plant superintendent, **Howard Iron Works**, Buffalo, died Feb. 9.

Alfred G. Mohrman, New York dis-

trict sales manager, **Bridgeport Steel Co.**, Bridgeport, Conn., died Feb. 2.

Melvin H. Kuhl, 52, assistant general manager, industrial division **Timken Roller Bearing Co.**, Canton, O., died recently.

Henry L. Balderston, 71, a founder and partner in **Precision Thermometer & Instrument Co.**, Philadelphia, died Feb. 10. He retired in 1951.

Irving C. Bolton, 65, vice president in charge of finance, **Warner & Swasey Co.**, Cleveland, died Feb. 11 at Palm Beach, Fla.

John Tod, 82, executive of severe concerns, and a director of **Youngtown Sheet & Tube Co.**, Youngtown, for 29 years, died Feb. 1. He was a former executive of **Bridge Hill Iron & Steel Co.**

James M. Skinner, 64, retired president and board chairman of **Philco Corp.**, Philadelphia, died Feb. 13.

...with TYCOL lubricants on hand!

Like metal fabrication, for example. There's a Tycol lubricant for any application you can name: For instance, what about tough machining jobs? . . . Tycol Afton cutting oil keeps cutting edges cool . . . lengthens tool life between grinds. Machine tool hydraulic systems? . . . Tycol Aturbrio oxidation and rust inhibited oils keep them running smoothly. Open gears of metal forming equipment? . . . Tycol Amaclac lubricants cling like cat hair on a serge suit. You always get top performance with Tycol lubricants. Why? . . . Because each Tycol grease and oil is manufactured from high quality base stocks and *tailored* for a specific application.

Get the full story of the entire Tycol line from your local Tide Water Associated office today!

Over 300 Tycol industrial lubricants are at your disposal . . . engineered to fit the job!

New economies in hose fastenings...

Squeeze clamp open; slide over hose.

Join hose and hose connection.

Position, then release. Seals perfectly!

with *Eaton Reliance* **"HOZ-FAS-NERS"**

One look at Reliance's new development in fastening rubber, plastic or fabric hose to hose connections—and you will see a new, profitable yet proven way to cut assembly costs! Although low in unit cost, Reliance Hoz-Fas-Ners provide an exceptionally tight seal through constant tightening action. Manufactured from special spring steel and factory coated with a rust-proof finish, Reliance Hoz-Fas-Ners reduce assembly operations to the 3 easy steps illustrated at left. In actual use, Reliance Hoz-Fas-Ners extend hose life by virtue of its rounded surface design which does not exert the cutting action found in conventional hose clamps.

For complete details and sizes available on this new Reliance development, write today for the "Hoz-Fas-Ners" Bulletin . . . or call your nearest Reliance Sales Office.

STEEL

Production AND Engineering

NEWS AT A GLANCE

ATOMIC POWER PROTECTION—Atomic Energy Commission's project near Portsmouth, O., will get 18 of the world's largest circuit breakers each with an interrupting rating of 25 million kva at 330 kilovolts. Westinghouse is producing the \$2.5 million order. Operating in connection with sensitive relaying equipment, the breakers will automatically remove short circuits or faults within one-twentieth of a second after trouble occurs. Within a third of a second, when so desired, the breaker will reclose, re-establishing service if the fault has disappeared.

HOMEMADE CARBIDE TOOLS—They purchase only the cemented carbide tips at Solar Aircraft then mill braze and sharpen their own tools. Work on high alloy steels formerly necessitated a carbide tool inventory valued at \$40,000, and changes in design or production methods often left a large segment of the inventory practically useless. Today, six employees in the tool grinding department turn out 1400 to 1500 tools per month, at about half the cost of purchased standard tools. Shelf inventory is limited only to the carbide tips, and as additional supplies of tools are needed the department makes them to order. They've got their own system of tool numbering, so duplication is a simple matter.

p. 82

BETTER AMMUNITION LOADING

—High voltage fluorography combined with rapid automatic film processing, may show the way to lower cost and faster techniques for production inspection of melt-loaded ammunition in ordnance plants. Key to success of the technique lies in the discovery that fluorescent screens are capable under certain conditions of a highly discriminating brightness response at radiation intensities on the order of 2 million electron volts, even though this energy is far above their usual peak response energy.

PROPELLER POWER—An aircraft propeller incorporating the widest blades ever built is in limited production at Hamilton Standard Division of United Aircraft Corp. When mounted on a 5500-hp P&W T-34 turboprop engine, it will give more propulsive thrust for takeoff than any other propeller-engine combination in a similar advanced stage of development. Designed initially for engines in the 5000 hp class, the new propeller is the first of a line which in various combinations of numbers of blades can be adapted for engines of more than 9000 hp and airplane speeds of more than 500 miles per hour.

INSTRUMENTS OF TORTURE—Some of the things that electrical instrument manufacturers do to prove the ruggedness of their product is an amazing revelation. For instance, they've built a shock tester which pounds them from all angles with a 400-pound free-falling hammer. That's just

a starter; before they're through the delicate looking meters etc. are subjected to harmonic vibration in all directions, 45 minutes of banging and tumbling, temperature extremes, water dunking and humidity-pressure tests. Oh yes, when they're all through, the instrument has to pass an exacting electrical accuracy test. Building ruggedness into this equipment was originally pushed by the military, but industry in general is benefitting now that the trend toward machine-mounted instruments is gaining momentum.

COPPER SUPPLY BOOST—A new way to recover millions of dollars worth of copper from waste mills is foreseen as the result of experiments at Michigan State College. A coal tar product that removes copper silicate from impurities similar to the way soap removes dirt from clothing is the heart of the process. As much as 90 per cent of the copper-bearing mineral contained in samples was recovered in tests. In some cases only one pound of the new synthetic chemical was needed to recover 17 pounds of copper as copper silicate. Only the copper bearing mineral is recovered in the process and standard commercial processes must be used to produce pure copper.

HIGH PLATING OUTPUT—With more than 1200 different small parts to be plated, mostly for corrosion inhibiting, Ford's Rouge plant has a separate building next to the heading department which does the work efficiently and rapidly. Three automatic barrel plating machines, each capable of an output of 3100 pounds per hour, do the job, and each is arranged for rapid hand controlled feed and automatic discharge. Even moving the barrels into and out of the machine is easy on manual labor. Gravity roller conveyors move the barrels, and electric hoists elevate and dump parts into hoppers that feed the plating machines. p. 88

NO LONGER FORGOTTEN—For some years and with some justification, the operators stationed in the mill control pulpits considered themselves as the forgotten men of the steel industry. They had the exacting job of keeping bigger, better and faster equipment rolling steel to exacting specifications but had to do their work under conditions far from ideal. Modern mill control pulpits produce higher efficiency, lower labor turnover and a general dressed up mill atmosphere. They are engineered to suit each condition and are insulated against heat, have acoustic ceilings, sound deadening heavy steel walls and floors, indirect lighting and concealed wiring. Other features include: Air-conditioning, special operator's chairs, intercommunication systems, industrial television, etc. You can hardly blame the mill superintendent if he drops in often and stays a while.

Carbide-tipped tools are fabricated, ground and repaired in this department. Savings result from doing the work in the user's plant

Tool shanks are cut to length from bar stock. Here seat for carbide tip is being milled in

CARBIDE CUTTERS:

Made and Maintained at Home

Purchasing only the cemented carbide tips an aircraft company mills, brazes and sharpens its own tools. It saves as much as \$50,000 a year

By **MARTIN S. SCHLEGEL**
Chief Tool Engineer
Solar Aircraft Co.
San Diego, Calif.

WORKING almost exclusively with high alloy steels, Solar Aircraft Co., San Diego, Calif., finds the program of grinding its own carbide tools is paying handsome dividends.

This machining on tough alloys calls for large quantities of expensive cutting tools. In the past, Solar had to maintain an inventory of cemented carbide tools valued at over \$40,000.

Wasted Inventory—In addition to the money tied up in tools, there were other drawbacks. Often changes in design or production methods would leave a large in-

ventory of tools that were practically useless. There were so many special machining operations that many times the work needed to remodel a standard carbide tool was almost as much as to make the tool originally. Again, it was difficult to get tools in a hurry when they were required for use on special jobs.

Today, a half-dozen employees in the tool grinding department make 1400 to 1500 tools a month. They turn out these cemented carbide cutting tools at about half the cost of purchased standard tools. Practically no shelf inventory is

maintained, except in cemented carbide tips. Instead, every cutting tool is numbered—there are about 1000 different shapes and sizes currently in use, of which 200 are standard tools and 800 are special—and as additional supplies are needed, the tool grinding department makes them to order for the specific purpose.

Eleven Types—Department buys cemented carbides as sintered tips of various shapes and sizes. They are obtained from four different suppliers—Firthite, Carmet, Vascoloy Ramet, and Carboloy—all together eleven different types of

cemented carbide are obtained from different suppliers.

Supplies of sintered carbide tips are kept on hand. As new tools are needed, tool steel shanks are milled to correct size, with an opening for the carbide tip. Next, the carbide tip is brazed onto the shank. This is followed by a rough grind on the tip, and by semi-finished grinding. In both these operations silicon carbide wheels are employed. **Close Check** — Finally, finish grinding is done as required on a diamond wheel grinder. Dimensions of the tool are then inspected, and these with close tolerances are checked, using an optical comparator. The tools are then dipped in a plastic to protect the cutting surfaces.

Adjoining the tool grinding department is the tool crib, with open shelves separating the two units. On these shelves are finished tool shanks and from either room, the quantity on hand of any particular tool can immediately be seen by the workers.

Line—Entire operation is on a straight line production basis, with a minimum of moving from place to place, and no backtracking.

Grinding department is set up as a complete separate operation, not included as part of a general tool shop.

Machinists need not even visit the tool crib for cutting tools. An employee with a cart stocked with various tools regularly tours the plant, picking up dull tools and replacing them with newly made or sharpened tools.

In fact, throughout the entire San Diego plant there is not a single grinding wheel for tool sharpening except in the tool grinding department. Absolute uniformity is thus maintained.

Reclaimed Bits—The fact that for three years Solar has been making its own carbide cutting tools, at half the cost of purchased ones, is not the only saving. In the past, when tools were worn out, tool steel shanks with the remaining carbide were scrapped. Now used carbide tips are removed and shanks of worn-out tools are milled and reused over and over. And the salvaged carbide tips are resold by the pound.

With many special tools there are still other savings. It is possible to have a tool in operation in a

few hours for a special job. Often in the past Solar purchased a standard cutting tool and, to get the required sharp angle to the tip, was forced to grind away a large amount of carbide.

Quick Test—Now, in making these tools, an appropriate tip is simply brazed on the shank at the correct angle, practically eliminating the excess grinding. And, for special jobs, various types of carbide can be easily tested to get the best one for the job.

In addition to the making of cutting tools, of course, tools are resharpened by the tool grinding department. Solar estimates that the average tool is sharpened from 15 to 50 times before it is completely worn out. Between each regrinding, the average tool is used to remove 30 to 40 cubic inches of alloy steel in some machining operation. To handle the brazing of the carbide tips, Solar built its own furnace at a cost of \$75.

The firm is sold on the speed and efficiency of the system. About 85 per cent of all cutting tools used in the plant are cemented carbide and are passed through the sequence of operations.

After shanks have been milled, tips are brazed in place. Tools are fluxed and the tips brazed in this gas furnace

After tips are brazed they are rough ground on a silicon wheel. Then they come to a diamond wheel for finishing

Shock test is performed on this machine by free-falling 400-pound hammers. The closeup shows instrument mounted on the vertical test panel ready to receive the varying test blows

Electrical Instruments Can Take It

Punishing tests used by top manufacturers to meet military specs help the trend toward machine-mounted instruments in other industries. They're rugged if they pass these tests

TREND toward machine-mounting of electrical indicating instruments is accelerating the need for the same rugged construction that the military services require. Shock, vibration, temperature and moisture are only a few of the adverse operating conditions under which this apparatus must function—and retain accuracy, too.

Tests such as those devised at Weston Electrical Instrument Corp., Newark, N. J., torture instruments on an array of equipment that can exceed the severity of almost any application found in industry. Some of the things Weston and other instrument manufacturers are doing in their testing laboratories would bewilder their forebearers who concerned themselves mainly with electrical characteristics.

Shock Testing — Probably the most impressive equipment is that used for shock testing. Instrument to be tested is mounted by standard hardware on a vertical test panel and is then subjected to a total of nine blows up to 2000 foot-pounds in intensity. Blows are delivered by two hammers weighing 400 pounds each; one swings on a 5-foot arm to deliver side blows and back blows to the test panel, the other drops like a pile driver to strike an anvil on top of the test panel and thus deliver a top blow.

Mounting of the instrument, the height to which the hammer is raised, and the number of blows are all stated in the applicable instrument specifications so that all manufacturers use identical machines in an identical manner.

Considerable head room, a heavy foundation and a somewhat isolated location are required for the machine because of the size and noise involved.

Harmonic Vibration—While vibration tests aren't new, machines which impart simple harmonic vibration in either a vertical or horizontal plane are a result of subsequent military specification. Two such machines are in use at Weston, one with a work table that vibrates horizontally and the other vertically. These machines permit vibration of an amplitude up to 0.1-inch and at frequencies from 10 to 55 cycles per second.

Motor-driven cam automatically changes the frequency over the range once every minute. Manual control is also available if other frequency combinations are desired.

onic vibration, both vertical and horizontal, is up in these machines. The frequency from 10 to 55 cycles per second is automatically varied every minute

Tumbling test really bounces the instruments around. Machine is rotated at 5 rpm for a period of 45 minutes, and free drop within each compartment is about 12 inches

As in the case of the shock machine, heavy concrete bases are required for mounting.

Tumbling Test — The random jolting, falling, bouncing and tumbling that an instrument might receive in some severe application is duplicated in an exaggerated fashion in tumbling machines. The instrument to be tested is fastened in a cylindrical sleeve and placed in one of the compartments of a box-like structure that is rotated about its center. In rotating, the instrument is dropped from shelf-projections within the compartment.

Average test is 45 minutes long, and the speed of rotation is five revolutions per minute. Drops from one shelf to another in the compartment are 12 inches, which means that during the test period the instrument in effect tumbles through a flight of 450 steps, each about 12 inches high.

Temperature Test, Too—Instruments for use in the temperature range of -55°C to $+85^{\circ}\text{C}$, the frigid arctic to the torrid equator, are now possible. Weston has a wide selection of cabinets capable of testing for these extreme temperatures. Heated electrically to obtain the high temperatures, the cabinets are equipped also to reach the low temperatures either through mechanical means or by ice.

Maintenance of the desired temperature within close limits is achieved through automatic temperature recorder controllers. Windows in the cabinet permit obser-

vation of the instruments during the test.

Moisture and Water Proof — Moisture resistance is a must, so instruments are tested in a cabinet where temperatures range from 2 to 80°C with relative humidity up to 95 per cent. Automatic control gives predetermined cycle of specified temperature and relative humidity, and both are read and recorded throughout the test.

Instruments must be water tight, too. To make sure, they are placed in a water-filled test chamber and pressure is reduced to 2.5 inches of mercury (absolute), by motor driven vacuum pump. Tests last as long as four hours, and here again recorder-controller machines maintain and record the test conditions.

Electrical Checks — In addition to the testing equipment already described, instrument manufacturers must maintain a wide range of electrical equipment to accomplish calibration, checking, and testing of the electrical characteristics. This equipment includes precision potentiometers, standard cells, standard resistances, transfer standards, instrument potential and current transformers, bridges and regulated power supplies of various alternating and direct current voltages.

Also available is equipment for dielectric strength and insulation resistance tests, oscillators for frequency error testing, and large current carrying coils or loops for magnetic influence or external field influence tests.

Temperature cabinets permit study of instruments under arctic or tropical conditions. To attain lows of -103°F takes 50 hp of motor capacity

On Jan. 19 STEEL announced a Specifications Handbook based on the new Cross Index of chemically equivalent specifications and identification code. Response from industry has shown there is a real need for this complete rundown on metal specifications. Presented here are additional facts on how this valuable reference came to be.

Teamwork Smooths Out Specifications Trouble

Standardization trend advances on many fronts. Cross Index of chemically equivalent specifications is first major compilation from military agency. More will come

MUCH OF THE CREDIT for victory in World War II was due to the close relationship between the military departments and American industry. Productive strength of our plants, properly applied in the battle zones by the military gave victory.

Today, industry-military co-operation continues to work. Objective: To make defense efforts more productive. One line of attack which promises to pay real dividends is work on standardization.

Taking the lead for the military in the drive toward standardization is the Defense Supply Management Agency. Created by Congress in July 1952, it is in the business of providing the tools for effective military supply management.

Trend toward standardization of our productive potential is also evidenced on many fronts by work of special industry teams and task forces.

Standards Authorized—The Defense Cataloging and Standardization Act passed by Congress last year gave DSMA responsibility for: 1. Cataloging all items of supply used by the military department; 2. reducing the variety of such items through simplification studies; and 3. issuing specifications and standards covering required items. Furthermore, the agency is to see that all inspecting and testing facilities are used to best advantage and is to unify, where practical, the methods of packaging employed by the various military activities.

Of equal significance the agency is charged with improving relations with industry as regards the supply management activities of the Department of Defense.

Responsibilities Broken Down—DSMA absorbed the former Munitions Board Cataloging Agency and Standards Agency when it was created. It is headed by Joseph W. Fowler, a former admiral, whose

career centered about Navy industrial activities.

Fowler organized DSMA to meet its responsibilities by setting up three policy-making co-ordinating offices: Office of Cataloging; Office of Standardization; and Office of Inspection. Operations in all three areas are conducted by assignment to elements of the military departments having major interest and the best qualified technical personnel to meet a particular problem.

DSMA offices set policy, establish procedures and control programs for meeting the obligations of the law. Packaging matters are handled by the Packaging Division, Office of Standardization.

Industry Men Help—Recognizing industry's interest in the effectiveness of its program, DSMA makes extensive use of industry advisory committees to meet specific problems. Such committees now exist on internal combustion engines, power cranes and shovels.

conditioning and refrigerating equipment and packaging.

Generation of reference works available to industry is corollary to the tasks of establishing and maintaining a single military supply catalog, a unified Department of Defense series of specifications standards, and standard methods and procedures for inspecting, testing and packaging military supplies.

What Has Been Done—The Office of Cataloging has prepared and issued: The Federal Code for Manufacturers; Directory of Metalworking Machinery; The Coded Index of Materials.

The Cross Index of chemically equivalent specifications and identification code, which is the basis of the Specification Handbook just published by STEEL, is the first reference work compiled by the Office of Standardization. The complete document will be known as DSMA-M1 by the Department of Defense.

New Cross Index—In 1951, recognizing that a similar document issued during World War II was obsolete, the military departments asked the Munitions Board Standards Agency to bring it up to date and reissue it. The Department of Air Force was assigned responsibility for this task and contracted

with the General Motors Corp. to undertake compilation of this data. Late 1952 saw approval of the manual by Office of Standardization.

The opportunity for STEEL to bring its edition of this reference work to its readers as the Specifications Handbook was made possible only through the co-operation of Air Force, Army, Navy, General Motors, Defense Supply Management Agency, and Superintendent of Documents.

Common Denominator—Basis of the Cross Index is a single five-digit number for ferrous and nonferrous alloys of similar composition covered by a variety of specifications. It thus provides a reference by which the material compositions of different specifications may be compared.

The materials covered by the specifications included in the new Cross Index are the ferrous and nonferrous metals and alloys. Each specification is assigned a code or group number which is common to all other specifications for materials of similar chemical composition.

Chemical Composition—In the first part of the Cross Index, groups of specifications for material of similar chemical composition are arranged in the numerical

order of the code numbers assigned to each group of such specifications. Four items of information are listed for each specification: 1. Specification designation or symbol; 2. general form of shape of material specified; 3. the initial which designates the agency which issued the specification; 4. detail chemical composition expressed as percentage by weight of the material required by the specification.

Specifications Listed—The second part of the Cross Index lists specifications for ferrous and nonferrous metals. The specifications listed by each agency are given separately.

Table II in the Handbook shows specifications included in the Cross Index. They are listed in alphabetical or numerical order with this information: 1. Specification designation or symbol; 2. code number which has been assigned and which serves to index the specification in Part I; 3. the complete title of the specification.

The Specifications Handbook published by STEEL is based on detailed chemical compositions as given in the first section of the Cross Index code and does not include nominal compositions. A special section in STEEL's Handbook also gives the correlation between producer designations for aluminum and specification code number.

Plans Take Life—Program for the new Cross Index was firmed-up on December 27, 1951 at a meeting called by the Munitions Board Standards Agency. Chairman of this meeting was MBSA's B. Rosenzweig. Members of the different services were present to assist in rounding out the job.

Outcome: Department of Air Force was assigned front line responsibility for the task. Work was done by R. L. McWilliams at General Motors under research and development contract (33-600)—6852 with the Air Force. Working closely with the GM project were: A. W. Sumpter, civilian chief, requirements branch HQ air material command; Maj. M. L. Campbell, U. S. Army G-4; Cdr. Harold B. Goodwin, U. S. Navy BuShips, and Maj. W. S. Ferguson and D. B. Sullivan, Wright-Patterson Air Force Base.

The demand for STEEL's new Specifications Handbook has exceeded all expectations. Thousands of requests have already flooded our Readers' Service Department and more are being received every day.

If you missed our original announcement January 19, we'd like to review the manner in which the Specifications Handbook is being made available.

1. Every STEEL subscription is entitled to one free Specifications Handbook as part of that subscription. For example:
 - a. If the subscription is in your name, you are entitled to a free Specifications Handbook . . . a sort of 53rd issue . . . as part of that subscription. If you have already requested your copy, it is on its way to you by now.
 - b. Every new subscription entered during 1953 will also be entitled to a Specifications Handbook at no extra charge.
2. Additional copies of the Specifications Handbook will be available. However, our initial supply is being exhausted by the demand from current subscriptions.

More Handbooks are being printed and, as soon as they are ready, additional copies will be sold at the following rates:

1—10 copies—	\$2.00 each
11—25 copies—	1.90 "
26 or more	1.80 "

All requests for the Specifications Handbook should be addressed to Readers' Service Department, STEEL Magazine, 1213 West Third Street, Cleveland 13, Ohio.

Small Parts Barrel Through Plating

Three automatic barrel machines form backbone of efficient zinc plating line. Special handling equipment reduces handling needs, permits high output

By HERBERT CHASE

MORE than a thousand different parts, chiefly bolts and screws, are produced in a cold heading department of the Ford Motor Co.'s River Rouge plant. Many of these are made in large volume and thousands of pounds hourly require plating with zinc, primarily to inhibit corrosion.

To handle this large volume of plating, a separate building adjacent to the heading department is equipped to do the work rapidly and efficiently. Although an automatic rack plating machine is included and kept busy, it handles only a small volume as compared with three automatic Stevens barrel plating machines each of which processes approximately 3000 pounds of parts an hour. In all, about 1200 different parts are handled through the automatic plating machines.

Minimum Labor—All the automatic machines are arranged for rapid hand controlled feed and for automatic discharge as well as for automatic plating. Each operates in series with a Ransohoff machine that does continuous drying on a completely automatic basis. As a result, direct labor requirements are at a minimum and are largely confined (except on the rack machine) to getting barrels of parts into the machines and removing barrels of parts discharged after plating and drying. Even this labor is light, as barrels are handled on gravity roller conveyors and electric hoists elevate and dump parts

into hoppers that feed plating machines.

Acids are pumped into the building from outside storage tanks and solutions are handled by pumps as necessary. Electrolyte is constantly circulated, filtered and kept at desired temperature by automatic means, hence sludge is kept out of plating tanks and they rarely require draining. In an emergency, electrolyte can be dumped into a 15,000-gal tank below floor level and can be pumped back subsequently. It is never discharged into sewers.

Air Flow—Special attention is paid to ventilation. Filtered fresh

air is forced into the plant through large ducts above plating machines and exhaust fans draw fumes away through high level ducts above aisles at sides of the machines. This affords rapid and large volume changes.

Parts to be plated are received from the heading department in metal barrels and are deposited on gravity roller conveyors near floor level, whence they are moved as needed to electric hoists. This applies to the barrel plating set-up as does all subsequent description as the rack plating machine handles only relatively minor quantities and is operated along conventional lines.

Pushbuttons operate this barrel hoist for headed parts to be plated. At the top, each barrel is automatically tilted and dumps its contents into a hopper from which parts are fed into plating tanks.

va hand loading and unloading
acks.

Barrel Roll—Barrels of parts set
in the hoist cradle are elevated by
pushbutton. When at proper level,
the barrel is tilted automatically
and contents discharge into a hop-
per for feed to the plating setup
through a chute equipped with a
Syntron feeding device. Then the
empty barrel is lowered and shifted
to a point for subsequent reloading
of plated parts.

From the chute, parts feed into
plating baskets at a point where
each barrel dips to the loading sta-
tion. An operator at this point
shifts off the feed when the basket
is properly loaded. Each basket
has a perforated plastic covered
shell and is supported on a
shaft whose position changes as
needed in shifting to and from
loading and unloading positions and
from tank to tank in the plating
line. A gear on the shaft engages
back and rotates the basket where
required to keep the parts tumbling
to insure uniform treatment.

Electrolytic Cleaning—At the
first tank in each plating machine,
baskets dip into a 12 to 17 per cent
solution of No. 52 North Western
alkaline cleaner heated to 180-210°
and remain rotating and advanc-

Operator loading a plating basket (or barrel) from the Syntron controlled chute, which is fed from the hopper above it. Each basket passes under the chute to give ample loading time and then shifts above the tank at right

ing through this tank for 5½ min-
utes. Then they receive a hot dip
and spray rinse of ½-minute dura-
tion in water heated to 210° F, at
the second tank. This is followed
by a 5½-minute dip in a 10 per
cent sulphuric acid at 140° F, to
slightly etch surfaces, and by a
cold water rinse for 30 seconds.

Next, comes electrolytic cleaning

in a 12 per cent solution similar to
that in the first cleaning but at
140° F. Cleaning is done with the
work alternately anodic and cath-
odic for 1-minute intervals over
a total period of 3 minutes during
which total current flow is 1200
amp.

After the 30-second rinse in
warm water, baskets dip in a solu-
tion containing 4 to 6 ounces per
gal of cyanide salts at 80° F for
1 minute. This makes the parts
ready for plating and baskets im-
mediately enter the plating tank.
There they remain 15 minutes and
receive a zinc coating 0.0003 to
0.0005-inch thick.

In this plating, zinc ball type
anodes are set in perforated steel
containers and the solution is held
at 90° F. This is a standard Ford
zinc plating solution and contains
12 ounces of zinc cyanide, 4 sodium
cyanide and 10 caustic soda per
gal. Circulation through the tank,
filter and heat exchanger is con-
tinuous and the cycle time is 64
seconds. Current supplied is 2000
amp at 12 volts.

Set for Drier—From the plating
tank, parts pass in succession
through four cold water rinse tanks
and then receive a quick in-and-out
bright dip in a solution containing
15 ounces per gal of bichromate.
This is followed by three cold and
one hot water rinses, after which
the baskets reach the end of the

Loading end of one Stevens barrel plating machine, left and, at top right,
barrel that has just discharged parts in the hopper below it. Under the
hopper is chute with Syntron unit that controls the flow to plating barrels

Racks for this plating machine are loaded and unloaded by hand with parts not adapted to barrel plating. Operation of rack machine is conventional

plating machine and dump into a hopper from which the parts feed into a Ransohoff dryer.

This dryer has a slowly rotating drum into which the parts feed gradually and are advanced by helical ribs as drying takes place. As parts are already hot when they enter the dryer, surface moisture is quickly evaporated, for the drum is kept hot by contact with hot water on its outside surface. Water evaporated from parts inside the hot drum is drawn off as vapor by a suction fan.

At the outer end of the drum, parts feed out gradually into a chute down which they slide into a barrel placed on the roller conveyor to receive them. Baskets of the plating machine, after dumping into the dryer, continue around the circuit until they reach the reloading point and are recharged.

Segregation—In all, more than a thousand different parts are handled through the Stevens machines in batches of different size. Inter-mixing doesn't occur as the parts remain in separate batches. After a given loading, the hopper is never reloaded with a new batch of different parts until the prior batch feeds out. Consequently,

each plating basket receives its own small batch and it remains in this basket until dumped into the dryer near the end of the cycle.

There is, of course, a fixed interval between each basket dumping and dryer speed is so set that a full basket charge will feed out of the hopper of the dryer before the next basket dumps into it. As a result, there is always an interval between the discharge of one basket load from the dryer and the time when the next load starts to discharge. This interval is used to change barrels unless the operator knows that the next lot is of the same part and will go into a barrel already partly filled.

Only two men per machine are needed. One sees that incoming parts are dumped into the charging hopper as needed and keeps parts feeding into plating baskets as they pass the loading station. If he fails to load an occasional basket, no harm results, save a slight loss in total output. Reloading of barrels at the end of the cycle takes only part of the second man's time and he can see that empty barrels are on the conveyor and that those unloaded are pushed along as an empty is put in place.

NBS Studies Copper Strai

STRENGTH, ductility and hardness of copper are markedly affected by its prior strain history according to a study conducted by the National Bureau of Standards. Tensile tests were made on oxygen-free high-conductivity copper initially as annealed, as cold drawn different amounts and as prestrained to creep at 110, 250 and 300° F.

Considerable interest has been stimulated among metallurgists by suggestions that tensile properties of metals are dependent only upon the instantaneous strain state of the metal, and are practically independent of the manner in which this state is attained. Previous NBS work has shown, however, that as some metals and alloys are deformed, hardening and recovery occur in such a manner that subsequent tensile properties are materially affected.

Fast vs. Low Strain—Cold drawing the copper at relatively fast strain rate generally resulted in increased strength and hardness, but in decreased ductility (as measured by the extension and reduction of area at fracture). Prestraining at high temperature or at a low strain rate, on the other hand, generally resulted in reduced strength and hardness as well as reduced ductility.

Specimens with the larger grain sizes showed lower yield strength and hardness values; but grain size had very little effect on tensile strength, fracture strength, or ductility. Hardness values of the fractured tensile specimens, obtained at room temperature, confirmed results of tensile tests.

Further details of the study are included in NBS research paper 2354, obtainable from Superintendent of Documents, Government Printing Office, Washington 25. Price is 15 cents per copy.

Engine Block Machine Built

Completion of a Holeway machine capable of completing 55 operations on engine blocks at a rate of nearly two blocks per minute, announced by National Machine Tool Co., Richmond, Ind. Operations include milling, drilling, combination core drilling and chamfering, reaming, etc., vibrating chip removal and hole inspecting.

Here's an EASY WAY to machine Forged Steel End Caps

SURFACES MACHINED ARE
INDICATED BY HEAVY LINES

Use a 3U SPEED-FLEX Automatic Turret Lathe with P & J Tooling

Designed, engineered and built for rapid, accurate, economical production, the 3U Speed-Flex takes full advantage of carbide cutting tools for quick metal removal on a variety of small to medium size work. P&J Tooling will also make a big difference wherever the profitable machining of difficult jobs demands added efficiency.

FOR THE ULTIMATE in speed, precision and economy you need both P&J Automatics and P&J Tooling . . . industry's outstanding team for higher output, lower unit costs and improved work quality.

Machine your hard-to-handle jobs easier and better, the P&J way. Send today for your copy of the 3U Bulletin No. 145 — or ask the P&J Tooling Engineer to submit recommendations based on your own sample parts or prints.

Modern Techniques Produce Shell Cores

After carefully weighing out the proper amount of metal powder, it is poured into a mold and is compacted under 60-ton pressure

Cores are placed into graphite containers or boats and covered with asbestos powder for a 10-hour trip through the presintering furnace

Close military specifications require an unending series of checks. Attention to principles of mass production keeps tungsten carbide components moving with little manual handling.

TAKING a highly specialized job, the manufacture of anti-tank shell cores, Carbology Department, General Electric Co., keeps production flowing smoothly by using a variety of modern production techniques. Originally developed to pierce the heavy armor of German Tiger tanks the tungsten carbide cores are now being made for troops fighting in Korea and for the defense stock pile.

Two sizes are produced: A 10-pound core for 76 mm shells and an 8-pound core for 90 mm. Both sizes are produced on a pair of special presses exerting a 60 ton pressure for 13 seconds. Compacting of the tungsten carbide follows conventional powder metallurgy practice with the only difference being that paraffin is added to the powder before pressing to help hold their shape.

On the Way—Formed cores are placed four to a tray and ride down a roller conveyor to the presintering furnaces. There they are removed from the light trays and put into graphite boats. Each boat holds ten cores covered with asbestos powder. Excess powder falls into a catcher and is re-used.

Presintering takes place in an automatic electrically controlled hydrogen atmosphere furnace. Transit time through the furnace is ten hours with one boat coming out and another going in every 10 minutes. A rack and pinion arrangement moves the boats through the battery of five furnaces in the presintering line.

Ready for Forming—In the final stage of the furnace the paraffin is burned out and the second stage hardens the cores just enough to permit grinding. On the exit end of the presintering furnace

Pressure Processing

... whoever uses it in their
production is a customer
or potential customer of **H-P-M**

DIFFICULT SMALL PARTS call for H-P-Ms!

For difficult draws and other forming operations on short as well as long runs . . . Walker Mfg. Company, Ajax Division, finds H-P-M 150 and 200 All-Hydraulic Presses ideal.

Starting with one H-P-M, Walker has added more to keep pace with increased production requirements . . . reflecting real confidence in H-P-M presses we build.

If pressure processing is an important part of your production picture . . . it will pay you well to shop with an H-P-M engineer. Write today!

THE HYDRAULIC PRESS MFG. CO.

1044 Marion Road, Mount Gilead, Ohio, U. S. A.

Presses for Every Pressure Processing Application

Grinding wheel formed to a special shape provides a bullet shaped nose on core and adjusts it to right length

Four cores are packed into each boat for final sintering. Hinged conveyor sections simplify loading, unloading

boats pass through a cooling jacket where core temperature is lowered sufficiently to permit handling.

At the exit end a vacuum hose draws all the asbestos powder from the graphite boats and is reused. The cores are put on trays and again move on gravity conveyors to grinders for forming the ogive or nose.

Ogives are ground by silicon carbide wheels on Cincinnati No. 2 cutter grinders using a specially formed wheel. Tungsten carbide powder resulting from the grinding operation is collected by vacuum hose for salvage.

Following the grinding operation, cores are given a 100 per cent inspection prior to being loaded into graphite boats for final sintering. Four cores covered with aluminum powder go into each boat for the trip through the furnace.

Hardening Trip—Final sintering takes 8 hours with one boat loaded and another unloaded every 57 minutes. Design of the hydrogen atmosphere furnace permits only one end of the furnace to be opened at a time. At both the entry and exit end of all furnaces alternate conveyor sections are hinged permitting easy loading and unloading.

Inspection on a 100 per cent basis at this stage includes a wet-dry weight test for density, a run-out test and a length check. Next step is a 40-ton rupture test followed by final machining. Two Cincinnati centerless grinders perform both the rough and finish

grind on the cylindrical portion of the cores.

Close Checking—Still another 100 per cent inspection follows, indicative of the painstaking care taken throughout the entire manufacturing operation. Cores that satisfactorily pass the runout test are placed on the outer conveyor line, those requiring slight nose or base adjustment go to the inner conveyor line. Grouping of the cores is according to the required adjustments. Vitrified diamond wheels are used for the work. Bases are ground nine at a time to bring the cores to within the tolerances that are specified for length.

Final inspection checks all dimensions plus taking a Rockwell hardness reading. Cores' average hardness is 83A and rejects at this stage are virtually nil. Despite all the close checks exercised throughout the manufacturing operations, government inspectors take over after Carboly's inspectors are through. In addition to the dimensional and hardness tests spot checks are made of the core by again subjecting them to the 40-ton rupture test under the supervision of government inspectors.

That the care and skill exercised in manufacturing is paying off is attested by the fact that rejects by government inspectors are a rarity. Of even greater importance is the performance of the armor piercing shells in the field where they go through the heaviest tank armor.

Inspector checks core for length while another gets an automatic runout inspection. Rupture test is next step

Cores needing slight adjustments on nose or base are grouped according to work needed. Ogive is ground here

Look alikes don't always cost alike

Two coils of cold rolled steel, side by side, may appear to be identical. The analysis may be the same, the coils of equal weight, both labeled "strip" and both available for immediate usage. One may carry a price tag somewhat less than the other — what if it is a sheet mill product slit to a strip width? Well, if sheet-mill tolerances and finish will produce your end product satisfactorily that's the choice for you because sheet-mill products should cost less than strip. But if you are more interested in end-product cost than first-steel cost, you may be one of those who find that CMP Thinsteel is worth the difference.

CMP strip products in intricate or costly assemblies mean fewer final rejections and thus reduce labor costs. In many applications steel is a relatively unimportant item of cost when measured against labor and fabricating costs. If you can count on the steel being *just right* — as to gauge tolerance, finish, structure, and temper, you insure yourself against troubles outside your own control. In the last analysis you get what you pay for. If you want the best you'll check on the built-in values in CMP strip steel products.

Die Caster

Features

Two-Stage

Injection

In addition to the new principle of injection, the Lewis die forge casting machine has a high pressure die-clamping device exerting 650 tons pressure.

Small ram fills die cavity and concentric, larger piston gives final squeeze at 100,000 pounds pressure. Entire casting cycle needs only four gallons of oil

DEVELOPMENT of a new die forge casting machine which makes possible new economies in casting production and brings to the die casting industry a new concept of safe and easy casting operation is announced by Lewis Welding & Engineering Corp., Bedford, O.

This new machine, a result of eight years of research and development, employs the "cold-chamber" method of injection. It introduces however, a new principle which provides for rapid fill while the metal is molten, and high final squeezing pressure that prevents shrinkage voids as the metal freezes and excessive porosity due to air and gases being trapped in the dies.

New Die Clamp—In addition to a new principle of injection, the Lewis die forge casting machine features a novel method of clamping the dies together, known as the Hydra-Lock, which develops a final clamping pressure of 650 tons.

The clamping mechanism of the machine embodies three principal elements. A small hydraulic cylinder advances the platen, on which the moving half of the die is mounted, to a position wherein

the die faces are open only a fraction of an inch. A mechanical locking device holds the platen in the closed position. Incorporated in the platen structure is a 28-inch diameter hydraulic cylinder, actuated automatically through the control circuits, which does the final closing of the dies and supplies the final locking pressures.

Short Stroke—The stroke of this large cylinder is so short that only a fraction of a gallon of oil and a few tenths of a second are required for this part of the clamping cycle. High clamping pressure is necessary to resist the high injection pressures which the machine can develop.

Design of the Hydra-Lock clamping system gives the operator a much easier die-setting procedure and the short stroke of the clamping cylinder and the liberal clearances in the guides permit quick line-up of the die faces. Machine tolerates considerably more misalignment of the die faces, but still closes to give uniform bearing across the dies. Clamping cylinder action is such as to provide essentially ball-and-socket action within reasonably close limits.

Two-Stage Injection—The machine develops an injection pres-

sure of 100,000 pounds which is accomplished by a special hydraulic two-stage injection system. Two pistons are employed, one concentric with the other.

The small diameter piston travels at variable speeds up to 80 feet per minute to fill the die cavity with molten metal. When the die is filled, resistance is encountered and the larger diameter piston is activated. A total pressure of 100,000 pounds is developed with 2100 psi in the hydraulic system. This pressure is the maximum but can be readily adjusted to varying casting requirements.

Greater Flexibility—Flexibility of various die casting operations is introduced by the variable injection speeds and variable injection pressures. These can be adjusted to conform to the actual requirements of the die cavity and the natural flow of the molten metal into the die cavity.

Due to the short stroke of the hydraulic clamping cylinder and the minimum oil consumption of the injection system the complete casting cycle is accomplished with only four gallons of oil. This means minimum heat loss, minimum power loss, and the elimination of oil cooling devices.

YOU CAN APPLY the high physical and chemical properties of ENDURO Stainless Steel to duplicate parts you're running now—and still get fast automatic production.

Free-Machining ENDURO Bars are cold-finished by Republic's Union Drawn Steel Division especially for that purpose. They provide close tolerances, accuracy of section, uniform soundness, and fine surface finish.

Two grades are fully 90% as machinable as Bessemer screw stock. If 90% was your answer to the question above, you've probably had ex-

perience with Free-Machining ENDURO Bars. If you haven't, Republic metallurgists will be glad to give you prompt assistance on applications, processing, and use. Free-Machining ENDURO also is available in hot-rolled bars and in wire. Get more details from your nearest Republic District Sales Office, or write:

NEW CHAMBER KEEPS COMPONENT BACKLOG ON ICE

... production efficiency improves through minimized short runs

Cold Storage Smooths Aircraft Parts Forming

FREEZING, already a valuable manufacturing tool, is becoming an operation of considerable size as well as profitable speed. An example is the 5000-cu ft ice box Lockheed Aircraft Corp. installed recently in its Burbank, Calif., plant for cold storing metal.

Larger than two box cars, this refrigerator deep-freezes metal plane parts to keep them soft between fabrication steps. According to the company, the big-chamber freeze technique results in easier shaping, reduced breakage and smoother production flow.

Capacities, Advantages—The refrigerator measures 40 x 12 feet, 10½ high. It can cool 2500 pounds of aluminum from room temperature to minus 20°F in about 2 hours. Parts heated to as much as 970°F are quenched, moved into the ice box and frozen. Removed for forming whenever machines are ready, they are still soft and easily workable.

Among production advantages noted by Lockheed is the ability to schedule long runs of identical parts on presses or milling machines by putting a large backlog in ice. This cuts down re-setup and press time on heavy machinery

and eliminates delays between heat treating and forming. Scrap is reduced because of parts' improved malleability while cold.

Handling Provision—Adding to convenience, the chamber is located only a few feet from forming machines. To facilitate handling large parts, the chamber top incorporates a door accessible to an overhead crane. This 34 x 4-foot hatch accommodates the bigger pieces, such as the 32-foot-long integrally-stiffened wing panels used on the company's Super Constellation transports.

Longer Life for Furnace Doors

Use of ductile iron for forging furnace doors in a New England manufacturing plant will save that firm about \$25,000 a year in shop operations. The interior temperature of the furnaces in this plant is about 1950° F. Doors formerly used required replacement or repair in 6 days because of growth, warpage and scaling.

Trial installations of similar doors cast in ductile iron produced an average life of more than 300 days. Maintenance men, on the basis of this performance, estimate the shop can effect the \$25,000-a-

year saving by standardizing on ductile iron for doors on all 17 furnaces. Doors were cast by Taylor & Fenn Co., Hartford, Conn., licensed under International Nickel Co. Inc.

ASME Hears Conveyor Tips

Six suggestions for performing necessary operations on package loads at the same time they are moved by conveyors were presented by H. C. Kellers, manager of engineering, Lamson Corp., Syracuse, N. Y., at a New York sectional meeting of American Society of Mechanical Engineers.

They are: (1) Weigh loads while they are moving on conveyors; (2) count loads automatically, if possible; (3) automatically deflect loads so they can be distributed to various buildings, floors and floor areas; (4) use up-enders, down-enders and automatic vertical conveyors to place the units being conveyed directly into machines, instead of simply bringing the units to the vicinity of the machine; (5) use conveyors as live storage—keep work moving to eliminate unnecessary loading and unloading between operations; (6) use conveyors to automatically segregate and accumulate units into pallet loads, shipping slugs or groups for sealers to eliminate frequent setting and adjustment of sealers.

Mr. Keller also suggested better paper work in handling jobs so that orders, work sheets and the like are at the right place and at the right time for continuous flow of materials through a plant.

Flame Plating Booklet Readied

Application of undiluted coatings of powdered metals, such as tungsten-carbide, to metal parts is announced in a booklet describing the features of the new service. The 12-page booklet titled "Flame Plating" is a publication of Linde Air Products Co., division of Union Carbide & Carbon Corp., New York.

Properties of the coatings are covered, as well as the results of extensive comparative wear tests that indicate the excellent wearing characteristics of flame-plated tungsten carbide coatings. Booklet is available free from Linde field offices or company headquarters at 30 E. 42nd St., New York 17.

Here's the new.

LINDBERG CARBONITRIDING FURNACE

It's many-furnaces-in-one! • It's designed not only for carbonitriding . . . but also for hardening, carburizing, annealing and carbon restoration! • It's a self-contained unit! • It's easy to maintain!

Change tubes like the blades in your razor! It's easy to change the new thin-wall tubes—just lift 'em out and hang new ones in place . . . all in a matter of minutes.

The greatest advance in industrial furnace design and construction since Lindberg introduced the Cyclone forced convection tempering furnace back in 1935!

A 320 lb. load of CRS sleeves. Carbonitrided .010 to .015". 90 minutes in heating chamber. Temperature, 1600° F.

A 400 lb. load of CRS hex nuts. Carbonitrided .001 to .005". 60 minutes in heating chamber. Temperature, 1600° F.

A 120 lb. load of CRS screws. Carbonitrided .005 to .008". 45 minutes total time...temperature, 1580° F.

you must see the new Lindberg Carbonitriding Furnace. It's many furnaces in one... it's easy to maintain... self-contained unit.

Look these important construction features... features that will improve production quality and volume, and reduce production costs.

Furnaces in one... Furnace where is provided by the Lindberg endothermic atmosphere generator that is easily adjustable to supply different atmospheres not only for carburizing, but also for carbonitriding, restoration, bright hardening or tempering and normalizing. For annealing and normalizing the heated charge in the same chamber used for carburizing.

Easy to maintain... Instead of old heavy, unwieldy, horizontal radiating tubes... new gas-fired, lightweight (only 29 pounds) are used. They're easy to change... turn off the gas...

get on top the furnace... lift out the old tube... hang a new one in its place... and the thin, rolled metal tubes actually last longer!

Quench tank pit unnecessary...

Your Lindberg Carbonitriding Furnace is self-contained, including a built-in pitless quench tank... thus you avoid costly excavation and piping. But more important, this built-in quench tank minimizes distortion... quenching takes place within the furnace structure, by means of a vertically operated elevator. Heated charges are never exposed to the air... as is the case when work is transferred from the heating chamber to a separate quench tank. Uniform case depth is assured because each charge automatically remains at heat the same length of time.

Purge chamber... A specially designed chamber, built immediately above the quench tank and in front of the heating chamber, receives work load for purging prior to heating.

LINDBERG FURNACES

Flicker Control in Arc Furnace Power Supply

Pouring a heat of electric steel from a modern arc furnace that is equipped with latest control equipment. Large installations are constantly increasing.

First of two articles explaining methods of determining voltage flicker in electric furnace power system and suggesting an interpretation of the results in terms of established light flicker limits

By R. F. LAWRENCE
and
R. L. TREMAINE
Electric Utility Engineering
Westinghouse Electric Corp.
E. Pittsburgh, Pa.

USE of arc furnaces has steadily increased over the past years. At the present time the connected steelmaking arc-furnace load in the United States is approximately 1,400,000 kva. Most of the furnaces have been relatively small, but a few rated 25,000 kva are in service and larger ratings are being actively discussed. With arc furnaces being used for high-grade alloy steel and ingot production, it is apparent that the utility companies will be faced with supplying more of this type of load in the future.

The arc furnace load usually is considered as a good revenue load, because it has a good power factor and a good load factor. However, the wide load variations which occur especially during meltdown make it a difficult type of load to supply because it can cause objectionable voltage fluctuations.

During meltdown the furnace electrodes contact the scrap metal

and an arc is drawn, causing high currents of varying magnitude to flow in the supply system. This is the period which might produce objectionable flicker voltages on the system, thus necessitating corrective measures. During the refining stage the arc is more steady and the load variations are less.

Furnace Function—Electrically, particularly during the meltdown period, an arc furnace can be considered as phase-to-phase "faults" through a fairly high impedance, superposed on a base load. The fluctuating current drawn by an arc furnace produces sudden small voltage changes in the system. The magnitudes of the impedances of the generators, the transformers, and the transmission lines, and the magnitude and phase angle of the current change, will determine how much flicker voltage will occur at the generator bus and the step-down substations.

Ideal solution to the problem of

determining the size of furnace which can be successfully applied to a given system, would be a correlation between furnace and system size with number of flicker complaints. Such a correlation requires a survey of existing installations which is not now available. Such a survey is being considered by an AIEE subcommittee.

In lieu of this information, it is necessary to calculate expected flicker and interpret the results in terms of established flicker limits. This paper gives methods of calculating voltage flicker; and suggests an interpretation of the results in terms of established light flicker limits.

The basic information required in the application of an arc furnace can be summarized as:

1. Flicker voltage limits for arc furnaces.
2. Load swings caused by furnace.
3. System one-line impedance diagram.

Over 33% Greater Capacity For The Same Size

There is a challenge facing manufacturers today to build smaller and more compact machines with extra precision and to combine more operations in each machine. This makes the selection of the proper bearings extremely important. A definite plus factor in this selection is the availability of a precision bearing that will deliver extra load carrying capacity in a minimum amount of space.

Obviously roller bearings, and particularly those of the ball (needle) roller type occupy far less bearing space than equivalent capacity than ball bearings. Roller bearing capacity is built up in proportion to the effective race and roller contact provided. Thus a full type roller bearing without space wasting cages should provide the greatest capacity of any type of anti-friction bearing. However, to get a perfect bearing the resulting full roller complement must be prevented from skewing and binding where misalignment occurs in the application.

The Guidrol bearing is the accepted answer to all these requirements considering precision, load capacity,

Bearing	McGill Guidrol No. GRI-209	Brand A Bearing	Brand B Bearing	Brand C Bearing	Brand D Bearing
Published Load Rating	8370 lbs.	6700 lbs.	7000 lbs.	5520 lbs.	6080 lbs.

Capacities at 2500 hours average life at 100 RPM

long life, versatility of mounting, and ease of lubrication. Published ratings show the Guidrol CT Series bearing has over 33% greater load carrying capacity than the average of the four highest rated interchangeable bearings. As a result, a Guidrol bearing at least one size smaller can often be substituted with the necessary shaft and housing requirements reduced in size and cost.

How Rollers Are Guided

In the Guidrol bearing design the grooved rollers with full race width contact are prevented from skewing by a center guide rail. Normally the rollers run on a true axis

Fig. 1

Fig. 2

not contacting the rail and thus need no correcting. (Fig. 1) Should misalignment cause a shift off center (Fig. 2) the leading end of the roller is retarded by contact with the rail at location Y. The trailing end catches up, relieving the rail contact, and the roller then resumes normal operation.

Typical GUIDROL® Bearing Mountings

On a Hydreco Gear Pump Idler and Drive Shaft, 4 Guidrol bearings are used. The longer rollers of the Guidrol bearings are effective virtually to the edge of the races. This gives substantial support close to the gear and materially reduces shaft deflection.

Four Guidrol bearings support and guide an automatic spooling attachment across the face of the reel track on a 20,000 pound Gar Wood Reel-Lite Winch. The guided roller principle prevents skewing of rollers in the 4 vertically mounted bearings even with a 10,000 pound angular load per bearing. A fifth Guidrol bearing in the sheave provides added stability and eliminates binding due to off-center loading.

MULTIROL® Bearings

SE Series

CF Series

CYR Series

A new 140-page Bearing Reference Guide complete with 30 pages of vital engineering data has just been released by the McGill Manufacturing Company.

It has the full story on the advantages of Guidrol Bearings and in addition contains complete information on the well-known Multirol CF, CYR and SE Bearings. Send now for your copy of the McGill Catalog No. 52.

Makes automotive dreams come true

In the automotive industry, as in countless others, OSTUCO Tubing has what it takes to transform drawing board dreams into practical realities—infinite adaptability, great strength, light weight, and low cost.

Here are a few applications in passenger cars, trailers, buses, and trucks: Steering post columns, shock absorbers, bumper guards, mirror and light supports, piston pins, connecting rods, bearings, bushings, radiator and tank fittings, exhaust parts, radius rods, seat

frames, sleeves, axles, and carrier racks.

Leading designers and manufacturers in practically every field specify OSTUCO Tubing, seamless or electric welded, because OSTUCO manufactures, forges and fabricates all at one plant . . . and because OSTUCO is famous for consistent highest quality.

It will pay you to consult our experienced engineers about OSTUCO Tubing for your current needs or for redesigning your products to meet future competition.

Flicker Voltage Limits — A change in the voltage applied to a lamp produces a change in its lumen output. The voltage changes produced by an arc furnace are erratic, resembling abrupt and cyclic changes. Cyclic or abrupt voltage changes are termed flicker voltage which transferred to lumen output is known as light flicker.

Permissible voltage flicker is not universally defined nor is it standardized. It is dependent upon the individual observer, the type and wattage of lights, the lighting fixtures and interior decorations, ambient daylight, rate of change and magnitude of change. The human element in the form of the observer, present both physiological and psychological aspects. One individual may perceive flicker but not object to it; contrariwise, another individual may not only perceive the same value of flicker, but find it objectionable.

The rate of change of lumen output and the magnitude of change are important factors. For example, a change of 5 volts occurring once every three hours would likely not be objectionable while a change of 1 volt at the rate of six times per second could be objectionable.

Fig. 1 shows various recommended maximum allowable cyclic variations of voltage. This figure is reproduced from "The Visual Perception and Tolerance of Flicker," a report prepared by Utilities Co-ordinated Research Inc., New York, 1937. The greatest sensitivity to flicker occurs between 3 and 12 cycles per second.

Limits Evaluated—In an attempt to obtain some values of flicker voltage limits established by certain utilities, the authors contacted six companies which have arc furnaces on their systems or are familiar with the problem of application of arc furnaces. The information presented here gives a representative idea of thinking in the industry.

In most cases the flicker voltage limits of the different companies are presented in the form of a curve of permissible flicker voltage versus frequency. In the other cases the flicker voltage limit is given with no reference to frequency of occurrence or with

Fig. 1—Various recommended maximum allowable cyclic voltage variations

specific reference to one frequency.

Company A expresses permissible flicker voltage in steps as follows: Three fluctuations per hour to 15 per minute, 1.7 per cent volts; 15 fluctuations per minute to 1 per second, 0.9 per cent volts; one fluctuation per second to 15 per second, 0.4 per cent volts.

Company B uses a tentative limit of 1½ per cent voltage with no reference to frequency of occurrence for arc furnace applications. On an actual installation, the per cent voltage fluctuation was approximately 0.5 per cent with a few fluctuations slightly higher. Their experience has been good and no complaints from light flicker have been received.

Company C uses a curve of permissible voltage fluctuations versus frequency of occurrence. At the lowest frequency of one fluctuation per second, the magnitude of the voltage change is 2.2 per cent. The voltage magnitude is a minimum of 0.5 per cent at a frequency of eight fluctuations per second. At the highest frequency of 20 fluctuations per second, the voltage limit is 0.7 per cent. These limits are termed as objectionable flicker voltage limits which should not be exceeded and refer to cyclic changes. These limits would be applicable to an arc furnace application.

Company D has established a limit of 0.7 to 1.0 per cent for a frequency of 15 fluctuations per minute for arc furnace applications. The thought is to design for a limit of 0.7 per cent with a maximum permissible variation of 1.0 per cent. In general, this company attempts to avoid situations causing voltage fluctuations greater than indicated by a curve which shows about 0.4 per cent voltage change

at five fluctuations per second, 1.2 per cent at 15, and 1.5 per cent at one fluctuation per minute.

Company E uses limits applying to two groups of loads. Group I refers to small groups of people such as residences, small stores, etc. Group II refers to large groups of people such as office buildings, hotels, theatres, etc. Group I limits are 2/3 of the Group II limits, which are as follows: For frequencies of occurrence of fluctuations of one to four per second and 10 to 20 per second, the voltage limit is 1.5 volts; for frequencies of four to 10 per second the limit is 0.75-volt.

Company F uses a curve similar to that used by Company D except the minimum point is 0.5 per cent at five fluctuations per second.

The magnitude of the load swings determines the voltage fluctuations. The validity of the calculated results depends on the accuracy of the load changes assumed for the furnace. The available data do not tie down the value of the load change sufficiently accurate to eliminate all debate. Much basic data have been obtained on existing installations, but interpretation of these data is extremely difficult. Table I by B. M. Jones,⁽¹⁾ gives values of phase-to-phase load swings for various sizes of furnaces which occur with sufficient frequency to warrant consideration in evaluating flicker. Occasional swings of great magnitude can be expected. These data have been used to calculate voltage flicker.

Information on load swings for furnace transformer ratings high-

What

Shape is your business in?

**CAMERON PRESS - FORGINGS ARE
NOW AVAILABLE TO HELP IMPROVE
YOUR PRODUCT AND TO SPEED
UP PRODUCTION SCHEDULES**

Because of the limitations of conventional forging machinery and methods, many product designs have, of necessity, incorporated steel castings where forged steel members could be used to great advantage.

The closed die method of press-forging developed by Cameron Iron Works has vastly expanded the limits of size and shape of forgings,

thus extending the metallurgical and manufacturing advantages of forged steel to a wider range of product designs.

Numerous intricate patterns, weighing up to 2000 pounds, which have been considered impossible, or impractical, to forge from ferrous metals heretofore, are now being produced at Cameron.

Inquiries as to how Cameron press-forgings may be fitted into your product designs will be given prompt attention. Send us your drawings and specifications.

CAMERON IRON WORKS, INC.

FORGE AND ORDNANCE DIVISION

P. O. BOX 1212 HOUSTON, TEXAS

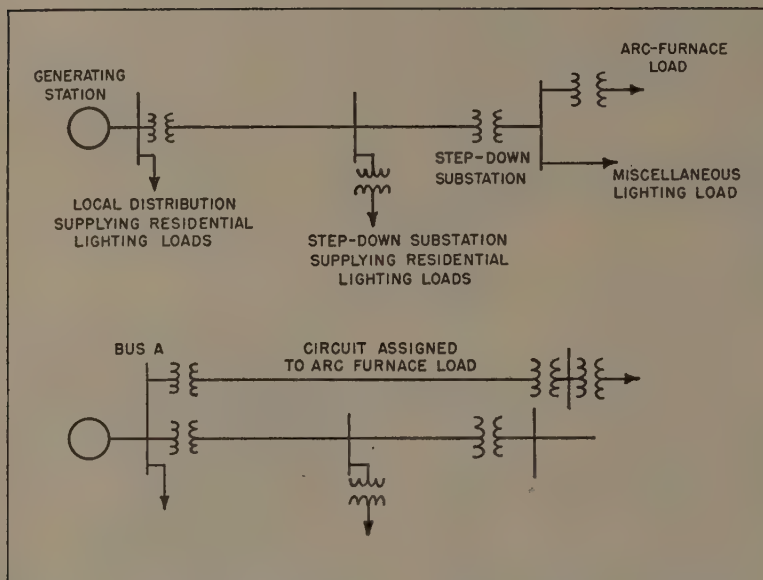

Fig. 2 (top)—Simple radial system for determining voltage flicker. Fig. 3 (bottom)—Basic change in supply system used to supply arc furnace load. The system elements are the same as those in Fig. 2, except where noted

er than those given is not known to the authors, but the data can probably be extrapolated with sufficient accuracy for calculations.

Calculation of Voltage Flicker—A simple radial system is illustrated in Fig. 2. It is desired to determine the voltage drop caused by the arc furnace load fluctuations. The maximum flicker voltage occurs when the power factor angle of the load change is the same as the impedance angle of the system. Because the incremental load change can have any power factor angle, it is safest to assume that it is the same as the system impedance angle. The maximum per cent voltage drop line-to-line occurs between the phases on which the load swing is present. The same per cent voltage drop appears as a line-to-neutral voltage on the secondary of a 30-degree phase shift transformation. The flicker voltage is determined by the load fluctuation and is independent of the steady-state furnace load. Therefore, calculations can be made based on incremental load changes only. These statements are readily verified by a symmetrical component analysis or by a Kirchoff law analysis of current and voltage provided the positive and negative sequence impedances of the circuits are equal.

The foregoing discussion pro-

vides a basis for a simplified procedure for determining the voltage drop caused by the arc furnace load fluctuation.

1. Determine the kva load swing and solve for the current,

$$I = \frac{\text{Kva Load Swing}}{E_{\text{Line-to-Line in Kv}}}$$

The voltage, $E_{\text{Line-to-Line in Kv}}$ may be assumed equal to 100 per cent.

2. Determine the per cent voltage drop = $\frac{2IZ(100)}{E_{\text{Line-to-Line in Volts}}}$.

As previously stated, the per cent voltage drop thus obtained will be the maximum whether it is measured phase-to-phase or line-to-neutral, regardless of the number of transformations.

Conventional symmetrical components analysis will produce the same results as given in this procedure if the positive and negative sequence impedances are equal. A correct analysis requires the use of symmetrical components if generator transient reactance is used to determine flicker voltage because the positive and negative sequence impedances of the system are different. Unless synchronous equipment is close to the furnace, the positive and negative sequence impedances of the system will be equal. Thus the simplified procedure can be used in the majority

of cases. Flicker voltage at point in the system which are closer to the source will be proportionately less.

The frequency of occurrence of the voltage fluctuations as calculated is not known. It is the authors' opinion that the voltage fluctuations may be assumed as having a frequency in the order of one to two per minute. A survey of the literature and the authors' experience indicate that this is a reasonable assumption. Using this frequency of occurrence, and referring to the examples of the limits established by several utilities, the conclusion can be drawn that a calculated flicker of about 1.5 to 2.0 per cent would be a satisfactory limit for arc furnace applications. Lacking an established industry standard, flicker limits for arc furnaces must be established by the individual utilities. These values are merely the authors' opinion.

Measures to Minimize Flicker—

The radial system shown in Fig. 2 illustrates an arc furnace load supplied from an electrical system. Assuming that the flicker voltage limits are established and that the arc furnace rating is known, the method given in the foregoing section can be used to calculate the voltage flicker.

Flicker voltage must be determined on the bus which is closest to the furnace and from which the critical lighting load is supplied. If the voltage flicker is not acceptable, some corrective measure must be used.

Several corrective measures can be used, some of which are not feasible from a technical standpoint. Other methods might be feasible technically, but impractical economically. The usual methods applicable both technically and economically are supply circuit changes, series capacitors, and synchronous condensers usually in conjunction with buffer reactors.

1. Radial Line. A basic change in the supply system might be used to supply the arc furnace load as shown in Fig. 3. For this solution only the voltage fluctuations at bus A must be kept to acceptable limits. In this case as in the following cases, the voltage flicker can be calculated by the simplified method previously described, or more accurately by the method of symmetrical components.

UNITED

CAN SERVE YOU . . . NO MATTER
WHERE IN THE WORLD YOU ARE

UNITED has been designing and building mills and machinery for the metal working industry on a world-wide basis, for 50 years. We have pinpointed a few of the locations of UNITED equipment; there are many more.

Inquiries concerning modern rolling mills and metal processing equipment are solicited from mill operators everywhere; for no matter where in the world you are—at home or abroad—UNITED can serve you.

Re-check YOUR Cost Relief Zone!

**Every Man Responsible for Tooling and Production
Can Take This Step Now and Get Results!**

Re-check your *tools* and *dies* . . . investigate this immediate source for new cost economies like hundreds of other plants are doing! You'll often be able to reduce costly die maintenance, shutdowns for regrinding . . . and step up output between grinds.

Records in hundreds of plants prove it possible. Look at the job shown above. A re-check of these punches and dies that produce muffler heads on an automatic transfer press, showed that a different die steel with the following properties was needed: (1) More uniform, through hardening, (2) Higher wear resistance, (3) Greater safety and accuracy in heat treatment. It was found that all of these properties were provided by *one* tool steel—Carpenter No. 610 (Air-Wear). Now, after many months of dependable service, the No. 610 tools are

still averaging 200,000 units per month, and costs are in line

One such case is not complete proof. But when many other plants report similar cases of cost relief, it adds up to an opportunity for you. Try this now: Use the Carpenter Matched Set Method to select the one steel best suited to cut costs. This Method is backed by *dependable* tool and die steel that stay on the job. Then, for rush delivery, call your nearest Carpenter Mill-Branch Warehouse or Distributor. THE CARPENTER STEEL CO., 139 W. BERN ST., READING, PA

Are You Missing These Opportunities In Your Cost Relief Zone?

- Less die finishing and adjusting
- Greater output between grinds
- Fewer heat treating failures
- Less machine downtime

On Job After Job Carpenter Matched Tool and Die Steels Have Made Them Possible!

TABLE I

single-phase load swings and
power factors of the swings
for various size furnaces*

Furnace Transformer Rating, kva	—Single-Phase Swing—	
	Load Swing, kva	Power Factor, per cent
2000	2300	43
3000	3100	46
4000	3800	47
5000	4300	50
6000	5000	52
7500	5800	55
9,000	6500	60
12,000	7000	63.5
15,000	7750	68.5
20,000	8000	70

In this table, single-phase load swing refers to phase-to-phase load swing as used in this paper.

2. **Flicker Bus.** In some instances flicker bus has been provided to supply arc furnaces and other flicker-producing loads. A flicker bus is really a generating bus used to supply only flicker producing loads. This bus may be tied to an adjacent generating bus or to the system through impedance. The impedance accomplishes the purpose of a buffer reactor described later. The magnitude of this impedance is critical, and an analysis similar to the example given later should be made.

3. **Series Capacitor.** A series capacitor can be used to nullify the effect of series line reactance and to decrease the voltage changes at the point in the system where voltage fluctuations must be minimized. This method has been used successfully on a few installations with small and large. Its success depends to a great extent upon the series resistance in the line. For example, on a line having a small inductor with a high ratio of reactance to resistance, nullifying the line reactance by the use of a series capacitor might reduce the light flicker only slightly. The real effect of current in the load changes the line resistance could result in excessive flicker voltage.

Where there are several lines supplying the arc furnace load, its use will usually be precluded on the basis of economics because a series capacitor normally would be required in each line. A line on which there are many distributed loads is usually unsuitable for a series capacitor. A series capacitor for flicker correction must be applied between the source and the point at which flicker must be limited, because it reduces flicker only on load side.

Use of a series capacitor fundamentally is not new. Its success has been brought about largely by the development of equipment to protect it under short-circuit con-

ditions. There are problems other than protection and determination of rating associated with the application of a series capacitor. A shunting resistor is usually required around the series capacitor. The need for such a shunting resistor may come about because of ferroresonance, self-excitation of motors, and hunting of synchronous machines. Ferroresonance is the condition resulting when a transformer is excited through a series capacitor and transformer magnetizing inrush current continues to flow under steady-state conditions.

Self-excitation of the motors is the condition arising from the motor acting as an induction generator which supplies low frequency power to the system. The low frequency currents which may be present during starting will cause a negative torque and the motor may not come up to full speed. Synchronous machines tend to hunt especially at light load, when the supply system has a high ratio of resistance-to-reactance. The addition of the series capacitor might make a circuit have an abnormally high ratio of resistance-to-reactance because it nullifies some of the system reactance. These problems which come up in the application of a series capacitor should be considered and evaluated for each case.

*Electric Arc Furnace Flicker Can Be Overcome, by B. M. Jones, *Electrical World*, April 23, 1951, pp. 114-116, 189.

Conference paper presented at the general summer AIEE meeting, Minneapolis, June 26, 1952.

(The concluding installment will be presented in next week's issue.)

Welding Problem Not So Tough

When the Olsen Mfg. Co., Boise, Idaho, took on the job of fabricating 150 automotive trailers, the welding of two goosenecks on each trailer looked like a difficult fabrication problem. Weld could not be completed in one setup due to the size of the machine carriage.

A Unionmelt welding head, mounted on a radial arm support, and construction of a drive wheel track for an Oxweld CM-16 machine made the job easy. Linde Air Products Co. equipment and application assistance helped solve the problem.

ELTON W. BRUNS
... Stamco chief engineer

RICHARD E. BLACK
... Stamco sales and service representative

MYRON L. KUCK
... Stamco chief draftsman

Stamco Inc. positions noted in STEEL Jan. 26 issue, page 62

(Continued from Page 78)

Minneapolis for De Laval Steam Turbine Co. The new district office is located in the Northwestern Bank Bldg. He formerly served with Detroit Stoker Co.

William S. Forrest was appointed assistant to the director of sales, National Motor Bearing Co. Inc., Redwood City, Calif.

Robert P. Melius was named merchandise manager of Skil Corp., Chicago, manufacturer of portable electric and pneumatic tools. He replaces William Ferry, appointed industrial sales manager. Mr. Melius formerly was with Delta Power Tool Division, Rockwell Mfg. Co., where he was vice president of sales. Jack T. Carlsen, industrial sales manager, was promoted to director of the newly formed sales training division.

F. Dier Tincknell was elected treasurer, Chain Belt Co., Milwaukee. He succeeds George M. Dyke.

Paul R. Gross was named regional manager, treasury department, United States Steel Corp., with offices in Chicago. He succeeds John K. Banville, named manager, treasury department, at Pittsburgh.

R. F. Doyle has resigned as executive vice president and general manager of Duchess Co., Fairfield, Iowa, formerly Appliance Mfg. Co. Dean L. Elliott, secretary and

treasurer, becomes works manager of the plant at Alliance, O. Mr. Doyle, prior to joining Appliance Mfg. Co. in 1950, was president of Alliance Mfg. Co.

Ray E. Greiner was appointed director of purchases for Speer Carbon Co., St. Marys, Pa., and its divisions. Mr. Greiner has been with Speer for ten years and purchasing agent for International Graphite & Electrode Division.

C. H. Brechin was appointed manager of Westinghouse Electric Corp.'s porcelain department, Derby, Pa. He replaces the late W. F. Bailey. Mr. Brechin formerly was manager of manufacturing at the porcelain department plant.

Officers were announced for Metal Briquettes Inc., Granville, Wis., a newly formed company to process machine shop scrap for use in foundries. T. N. Moore Sr. is president, T. N. Moore Jr. vice president, G. Milton Ehlers treasurer, and T. H. Spence secretary.

F. J. Stokes Machine Co. appointed L. E. Ritter sales engineer in charge of its new St. Louis office. He joins the company after serving with A. Y. McDonald Co.

Ross A. DeMatteo II, salesman in the Washington district sales office, was transferred to the New York office of Anaconda Wire & Cable Co. James P. Ruch, salesman

in the Kansas City office, transfers to the Detroit office. Bruce Van Wagner rejoins the Anaconda sales organization, assigned to the New York district office.

Cecil J. Mader, vice president, Tri-Clover Machine Co., Kenosha, Wis., was made a director.

Robert C. Case, technical superintendent of the Gadsden, Ala., plant of Goodyear Tire & Rubber Co., returned to Akron to assume new duties as chief engineer of the tire design division. M. H. Laatsch, chief chemist at Gadsden, replaces Mr. Case there, and J. L. Ryan succeeds Mr. Laatsch.

S. L. Jackson was appointed district manager of the Los Angeles office, and R. L. Reed as district manager of the Detroit office of Electro Metallurgical Co., a division of Union Carbide & Carbon Corp.

Trayer Products Inc., Elmira, N. Y., elected Harold E. Townsend president to succeed the late Charles H. Sayre. Mr. Townsend has been chief engineer since 1946.

James S. Walker was named manager of technical service, Hooke Electrochemical Co., Niagara Falls, N. Y.

Foundry Supplies Division, Fredrick B. Stevens Inc., Detroit, appointed Paul E. Williams, Elkhart Ind., as sales representative open

with

GULF SUPER-QUENCH

*Rockwell C-65 is a sure thing
on SAE 52100 steel balls,"*

**says Mr. John Genishus, Plant Manager,
Waterbury Steel Ball Co., Waterbury, Conn.**

"From our experience, there's nothing like Gulf Super-Quench for quenching steel balls for anti-friction bearings," says Mr. Genishus. "These balls require a uniform as-quenched hardness of at least Rockwell C-65 all the way through. Then we temper to Rockwell C-62. Metallographic examinations show we're getting a fine grain structure with Gulf Super-Quench and one which is

very homogeneous. We feel that a goodly share of our success in this operation can be attributed to this fast quenching oil."

No matter what alloy steels or shapes you quench, you will gain from the greater quenching power of Gulf Super-Quench. For further details on this outstanding quenching oil, contact your nearest Gulf office.

**GULF OIL CORPORATION
GULF REFINING COMPANY
PITTSBURGH 30, PENNA.**

Technical Service Data Sheet

Subject: RUST PROOFING WITH **PERMADINE®**

JOHN W. GOSSELIN
... asst. to president of Phoenix Mfg.

ating from the Indianapolis branch **Renard Brown** is representative in southern New York and north eastern Pennsylvania, operating from Buffalo.

Phoenix Mfg. Co., Joliet, Ill., appointed **John W. Gosselin** as assistant to the president. He has been connected with the company's operating and sales divisions since 1949.

Lewis E. Pilsbury was named resident manager of the recently opened district sales offices of **Phelps Dodge Copper Products** at 2408 N. Farwell Ave., Milwaukee. He formerly was with Chase Brass & Copper Co.

C. L. Horner was appointed supervisor of systems and procedure for **Chrysler Corp.**, Detroit. He joined the company in 1952 on the staff of the vice president and general manager, and for the last seven months has been engaged in special studies of systems and procedures.

Election of former Secretary of Commerce **Charles Sawyer** as director of **Kennecott Copper Corp.** New York, was announced by the company.

Robert L. Pierce was appointed assistant sales manager of the Pittsburgh district, **Jones & Laughlin Steel Corp.** He has been a salesman in the St. Louis district office since 1951.

G. M. Giannini & Co. Inc., Pasadena

Steel parts that have been Permadized and then "sealed" with a rust-preventive oil such as "Granoleum" are effectively protected from rust. And, if the oiled "Permadine" coating should be damaged, rusting will not spread beyond the area of exposure.

Note: Automotive and other rubbing parts subject to friction are usually given "Thermoil-Granodine" manganese-iron phosphate coatings for both wear-resistance and protection from corrosion.

DATA ON THE "PERMADINE" COATING

Type of coating	Zinc phosphate
Object of coating	Rust and corrosion prevention
Typical products treated	Nuts, bolts, screws, hardware items, tools, guns, cartridge clips, fire control instruments, metallic belt links, steel aircraft parts, certain steel projectiles and many other components
Government Specifications	U.S.A. 57-0-20; Type II, Class B MIL-C-16232, Type II U.S.A. 51-70-1, Finish 22.02, Class B AN-F-20 Navy Aeronautical M-364 JAN-L-548
Scale of production	Large or small volume; large or small work
Method of application	Dip Barrel tumbling, racked or basketed work
Equipment notes	Immersion tanks of suitable capacity. Cleaning and rinsing stages can be of mild steel. Coating stage can be of heavy mild steel or stainless steel.
Chemicals required	"Permadine" No. 1
Pre-cleaning methods	Any common degreasing method can be used. Alkali cleaning ("Ridosol"), Acid cleaning ("Deoxidine"), Emulsion-alkali cleaning ("Ridosol") - "Rido-line"; vapor degreasing, solvent wiping, etc., are examples. Acid cleaning may need to follow other cleaning methods if rust or scale is present.
Bath Temperature	190° - 205°F.
Coating time	20 - 40 minutes
Coating weight range	1000 - 4000 mgs. per sq. ft.
Technical Service Data Sheets	No. 7-20-1-2 T.M. No. 5

METALS

WE EXPECT the motor to roar when we push the starter, the wipers to swish away rain, the heater to pour out warmth. Berylco parts make this possible. For parts and key numbers, see below.

STRENGTH PLUS CONDUCTIVITY

Beryllium copper supplies the automotive industry with reliable low-cost answers

The element beryllium was an 18th century discovery which didn't amount to a tinker's dam until it was alloyed with copper in the 1930s. The result: miraculous. The new alloy retained the good conductivity and corrosion resistance of copper, with the strength and hardness of many steels.

Alert car manufacturers, always on the lookout for reliable materials which will give long life and eliminate costly breakdowns, were among the first to use Beryllium copper. It now appears in many small—but essential—parts of your car. Engineers know these parts will function perfectly for millions of cycles without relaxation or loss of strength or conductivity.

The outlook for expanded use of beryllium copper is extremely favorable. Increased supplies of beryllium and domestic mining activities will undoubtedly mean (1) the development of new alloys and (2) a substantial addition to the thousands of applications now in use. Manufacturers who would like to take

advantage of this versatile alloy are invited to share the experience and know-how of the world's largest producer. For information, write THE BERYLLIUM CORPORATION, Dept. 3B, Reading 19, Pa.

*Tomorrow's products are planned today
—with Beryllium copper*

Shown here are the Beryllium copper parts numbered in the 1953 car above—a few of the many which help deliver top performance. Reading across, they are (1) wire clips; (2) dimmer switch terminals; (3) antenna raiser; (4) windshield wiper springs; (5) cigar lighter contact; (6) heater control; (7) door switch spring.

Here, in the tool zone, is where the superior machinability of Union Drawn Steels pays profits.

PRE-TESTED MACHINABILITY TO HELP YOU MAINTAIN PRODUCTION...AND PROFITS!

6 HELPFUL MANUALS

filled with how-to-do-it information and data to help you use Republic Union Cold Drawn Steels. Write for "Union Drawn Pocket Library."

The "Pre-tested Machinability" of Union Cold Drawn Steels is assured by continuous test-production of this part on our own automatic.

Your set-up men and automatics can get into production sooner, with fewer headaches, because our automatic screw machine shop at Massillon, Ohio, is the world's largest producer of a completely useless part . . . shown above.

Day-after-day, a modern automatic turns out only this part. It embodies the 6 most common "automatic" operations . . . it tells us how our Republic Union Cold Drawn Steels will behave in *your* shop, on *your* machines. It also tells us how to make Union Drawn Steels even better for automatics . . . even *more* free-machining . . . even *more* profitable for you.

In *your* shop, our Republic Field Metallurgists can help you use the things we have learned in *our* shop . . . better set-ups, heavier feeds and faster speeds, most efficient tool angles . . . all the knowledge to help you make the most of Union Drawn *machinability* on your job schedule and your profit sheet.

When may we call?

OIL HARDENING TOOL STEEL

WL offers "Whelco" M—a tool steel of maximum toughness, hardness and strength—a steel to assure maximum results at low cost! "Whelco" combines great penetration of hardness, great toughness at high hardness, wide hardening range, fine grain structure, and desirable non-deforming characteristics. "Whelco" has good forging properties and is readily machinable in the annealed condition. All WL warehouses stock "Whelco" M tool steel in a wide variety of flats and squares. Call your nearest WL man for a trial order—the results will speak for themselves!

WL steels are metallurgically constant. This guarantees uniformity of chemistry, grain size, hardenability—thus eliminating costly changes in heat treating specifications.

BILLETS AND FORGINGS FOR PRODUCTION, TOOL ROOM AND MAINTENANCE REQUIREMENTS

ROBERT B. TAGGART
... New York Air Brake div. engineer

Riverdale, Md., appointed Wendell S. Walker engineering office manager.

Robert B. Taggart, executive engineer of Watson Flagg Machine Co., Paterson, N. J., joins New York Air Brake Co.'s Watertown Division as chief industrial engineer.

Arthur H. Kapnick was made manager of the Adrian, Mich., plant of American Chain & Cable Co. Inc.

E. C. Jacoby was made manager of the contract administration department at Weber Aircraft Corp., Burbank, Calif.

Newly elected directors of Firth Sterling Inc., Pittsburgh, are J. Fred Hedding and Harold E. Sweeney.

G. S. Kariotis was appointed sales manager of the southern California branch office of Sprague Electric Co., Culver City, Calif. He succeeds Thomas S. Bills, resigned.

F. H. Webster was appointed manager, Chicago western division sales office, for Hyatt Bearings Division, General Motors Corp. He succeeds C. L. Newby, retired.

Leo J. Rohrer was appointed manager of the order and scheduling department of Crucible Steel Co. of America, Pittsburgh. He was formerly assistant manager of that department, and succeeds Harvey R. Moll who now serves Crucible as a special consultant to the depart-

THIS EARLY BIRD GETS THREE TIMES THE WORMS!

That's the Mona-Matic for you!

"THREE TIMES THE OUTPUT!", says Gar Wood Industries, Inc., of their new Mona-Matic installation. Output has increased, on turning these worm shafts, from 2 pieces formerly put on the floor every 14 minutes, 45 seconds to 2 pieces every 4 minutes, 9 seconds—one man operating two machines in each case. That's more than a 255% production increase for the Mona-Matics!

There's a great performance story here, too. Only a machine built like the Mona-Matic can deliver satisfactory finish and good tool life while maintaining required limits on the intermittent cut over the forged

worm threads. The 2-speed motor on Machine #1 easily accommodates the turning of diameters as varied as those of worm threads and shaft end. Excessive stock removal from small end diameter is accomplished by dual template control on Machine #2. With two tools on rear slide of each machine, one faces the end of the shaft while one rough faces a shoulder and forms an undercut.

Here's a machine that can boost output and cut costs on long runs and short ones. Why not find out—right now—what it can do for you? Write for Booklet 1805 containing full information, data, job reports. It's new! . . . *The Monarch Machine Tool Company, Sidney, Ohio.*

Part—Worm Shaft. **Material**—SAE 8640 forging. **Operation**—turn complete for grind using carbide tools. Limits $\pm .001"$. **Comment**—with one operator for two machines in each case, output has soared from 2 pieces every 14 minutes, 45 seconds to 2 pieces every 4 minutes, 9 seconds—a 72% reduction in machining!

CLARK

Magnetic Amplifier

for MILL USE

The CLARK Magnetic Amplifier is particularly adapted for heavy duty mill applications.

Built like a transformer—with no moving parts and no valves, it is unaffected by shock and vibration. It requires no warm-up period, and practically no maintenance. It is rugged and reliable, and does not get out of adjustment.

Its ability to amplify a small signal current makes it ideal for service in voltage regulation, speed control, positioning, tension control and accelerating applications.

The picture shows CLARK Magnetic Amplifiers applied to Motor Operated Rheostats. No contacts are required in the motor circuit to reverse rotation. Pre-selected positions on the rheostats are provided by Push Button and Potentiometer remote control, or combinations of any desired number.

Within a range of 5 to 20 seconds, any selected rate of travel in either direction is available. There is continuous adjustment of position, and the speed of response prevents hunting or overshooting. Accuracy is maintained within one button on the Motor Operated Rheostat.

The power requirement is very low.

Greater production, finer performance and more uniform operation in a broad variety of applications in Steel Mills and other industrial plants result from the use of CLARK MAGNETIC AMPLIFIERS.

Consult CLARK for information regarding practical use of Magnetic Amplifiers in your electrical control operations.

THE DEMPSTER-BALESTER

1-2-3-4 Hydraulic Operation

BALES YOUR SCRAP METAL FASTER!

The key to low cost scrap metal baling is fast, consistent baling. The big capacity Model "600" Dempster-Balester high speed press pictured here will bale your scrap as fast as your crane can feed it! This tremendous baling speed is due to the Dempster-Balester's 1-2-3-4 hydraulic cycle. 1—Skip Pan Loader loads charging box (see Photo 1). 2—Skip Pan returns to loading position as Auxiliary Compression Door compresses scrap with a 45-ton force. (see Photos 2 and 3). 3—Charging box door is closed and scrap is baled, then 4—finished bale, weighing between 600 and 1,000 pounds, is ejected. (see Photo 4). Without question, *Dempster-Balesters* are the fastest, most efficient presses baling scrap! For complete information clip coupon below and mail to us today. A product of Dempster Brothers, Inc.

Lead Measuring Instrument

... checks 8-inch diameter parts

Universal lead measuring instrument determines accurately the lead of internal and external threads on work parts up to 8 inches diameter and 18 inches long. The headstock, in addition to locating the centers, carries what

virtually the barrel of a specifically constructed micrometer. Tailstock can be used in either of the two runways to accommodate work of various diameters, and can be locked in any position.

Machine can be supplied with an attachment for measuring lead of screw threads up to and including number of one in four on the diameter. Sheffield Corp., Dept. ST, Dayton 1, O.

USE REPLY CARD—CIRCLE No. 1

Milling Machine Line

... automatic or manual control

Line of automatic milling machines is offered in plain, duplex and plain rise-and-fall styles. Each powered at the spindle by 3 or 5 hp motors. Standard table travels 24 inches, although longer table travel—up to 144 inches—is available for long and comparatively light work. Through a

cycle selector unit, a single lever initiates the complete milling operation. To aid in setting up the machine, all automatic features can be nullified or bypassed for manual control.

Bed walls are considerably wider than the table. Intervening

space serves to catch coolant and chips and direct them to a chip compartment in the right-hand end of the bed. Table ways are automatically pressure lubricated with filtered oil and completely protected against dirt, chips and coolant. Twenty spindle speeds range from 30 to 1200 rpm. Cincinnati Milling Machine Co., Dept. ST, Cincinnati 9, O.

Engineer answers vital questions about the strongest wire rope made—Flattened Strand

Why does Hercules® Flattened Strand wire rope continue to outperform round strand rope by 2 to 1 or more? Can you use it? Here, Walter C. Richards, chief engineer, A. Leschen & Sons Rope Co., tells you.

More and more wire rope users are continually experiencing or hearing about spectacular performances of Hercules Flattened Strand wire rope. The explanation is clear.

First, Hercules Flattened Strand is a Super-rope because it packs 10% more steel than any round strand rope of the same size. It's 10% stronger...10% safer.

Second, Hercules Flattened Strand wears longer and more evenly. That's because there are four wires per strand contacting sheave grooves instead of one.

Third, Hercules Flattened Strand resists crushing and internal strand-cutting, because strands rest snugly against each other, keystone fashion, with less internal pressure or friction.

Fourth, Hercules Flattened Strand prolongs its own life and the life of equipment, because the relatively smooth surface of the rope prevents corrugating and wear on sheave grooves.

Can you use it?

It's a known, proved fact that no other wire rope made can equal Flattened Strand on applications such as hot ladle cranes, skip hoists, and dredge ropes. It is also best on a variety of other equipment both large and small. For many uses, it is truly a Super-rope.

With Flattened Strand, notice how four wires per strand contact sheave grooves—reducing rope and equipment wear.

But, the question is, can *you* use it to advantage? That can be answered only by a qualified wire rope engineer who is thoroughly acquainted with the characteristics and proper uses of Flattened Strand rope.

Check with the authority

That means, check with Leschen. It's wise to do so because Leschen pioneered and perfected Flattened Strand wire rope. Leschen developed special machines to make it. Leschen conducts continuing research on correct uses. Leschen is the authority.

If you discover you can use this Super-rope—Hercules Flattened Strand—you'll soon begin saving time, labor and money. Why not investigate *now*?

AVAILABLE FOR THE ASKING

Weldment Cleaning

American Wheelabrator & Equipment Corp.—Just how airless blast cleaning is used on large weldments in a leading Midwestern plant is described in illustrated bulletin 864. Included in this case study are facts and figures showing cost savings effected.

Metering & Controls

Automatic Control Co.—4-page illustrated publication "The Autocontrol" deals with line of remote metering systems and automatic control for such equipment as pumps. Will be sent regularly to those concerned with automatic control systems.

Colloidal Graphite

Mason Colloids Co.—Summary of "dag" colloidal graphite function as a high temperature lubricant is contained in illustrated bulletin 23. Its composition, several studies and various applications are covered in its 4 pages.

Adjustable Speed Drive

Advance Electric & Engineering Co.—3-page illustrated bulletin D-30 gives you technical data, construction features, selection information and dimensions of V*S drives or planers. How it is used with electronic controls for rapid reversals is explained.

Electrodes For Cast Iron

Boy Rods Co.—Machinable welds in cast iron can be made with Nickel-60 electrodes, described in illustrated bulletin AR52-2218. Recommended welding procedures, other and application examples are included.

5-Inch Precision Level

Bess-Bement-Pond Co., Pratt & Whitney Div.—Wherever horizontal lines must be determined within

close limits the P & W 15-in. precision level can be used. Described and illustrated in 4-page circular 544, its scale can be read to a 0.0005-in. variation from the horizontal in 1 ft.

Gouging & Cutting

Arcair Co.—How to gouge and cut all metals with only carbon arc and compressed air is told in 4-page folder on the "Arcair Torch." Applications for removing pads and gouging defects in alloy steel castings, for cutting out corroded section in pressure vessels and back gouging welds are illustrated.

Metal Crusher

American Pulverizer Co.—Offered as a simple means for reducing metal turnings to chips and thus obtaining maximum return from scrap, the model 1700 rolling ring crusher is described in 2-page data sheet. Machine has capacity of 1 to 1½ tons per hour and will handle alloy steel, steel, aluminum, brass, copper or bronze turnings.

Cutting Abrasive

Allison Co.—General recommendations for selection of Allison abrasive wheels, a chart relating best wheel for dry or wet cutting many materials and much basic cutting info is contained in 16-page illustrated brochure "Abrasive Cutting by Allison." Data on types of cutting machines and maintenance of them are included.

Wire Rope Sling Guidance

A. Leschen & Sons Rope Co.—64 pages of practical information on the selection and use of wire rope slings are contained in Sling and Fitting Handbook No. FS-52. Charts show proper calculations to be used in determining the size of sling required in a given application, the correct sling angles in relation to the load and procedures in applying fittings.

page illustrated folder 96. This high-bricant features antiseizing properties, low coefficient of friction at extreme bearing pressures and tenacity when applied to metal surfaces

86. Welding Alloys Wall Chart

All-State Welding Alloys Co.—Measuring 18 x 27 in., this wall chart covers properties and applications of 41 welding rods and electrodes, plus the best flux for welding, brazing, soldering, cutting or tinning.

EDITORIAL REPRINTS:

87. Metal Joining

In metal joining, low heat requirements of organic resin bonding eliminates heat-affected zone and minimizes heat distortion common in welding, brazing and soldering. A versatile bonding method adaptable to present production facilities is described in STEEL reprint "Joining, Distortion Minimized" by H. Thielsch and J. R. Charlton.

88. Cutting Speed

In STEEL reprint "Cutting Speed Horizons Limited," Hans Ernst of Cincinnati Milling Machine Co. formulates an easy way to figure the fastest practical cutting speed for machine tools. He writes on the contention that jacking cutting speed up to the sky doesn't necessarily lead to a "promised land" of production and everlasting tool life.

89. Seamless Tubing

G. B. Brown of Tube Reducing Corp., in STEEL reprint, "Powerful Giant Will Reduce 18-Inch Tubes," describes machine which will produce world's largest light-wall seamless tubing by a cold reducing method. This giant, still in the preliminary design stage, will dwarf all existing machines.

90. Modern Checking Devices

To meet precision demands, producers of tool steel must utilize the most modern testing device at every stage of production. Close coordination between industry and users advances the art. L. C. Grimshaw of Firth Sterling Inc., in STEEL reprint "Close Checks Produce Top Tool Steels," covers some of the latest equipment and methods used to assure top tool steel production.

79. Abrasive Wet Blasting

Abrasive Wet Blast, Inc.—Abrasive Wet Blast, the liquid abrasive surface treatment which cleans, finishes, etches and blends production items and tools; what it does; why it's better; and how it works are covered in 4-page brochure. Specs on the Wet Blast machine are given as well.

80. Transfer Machine

Avey Drilling Machine Co.—Here, in a 4-page illustrated bulletin, you can read how sixty (60) tractor crankshafts were given a series of holes on a 12-station transfer machine, the Avey Line-O-Dex. Design of machine is shown and operation sequence is summarized.

81. Welding Process

Air Reduction Sales Co.—12-page catalog 17 describes equipment and supplies employed in the Aircomatic inert-gas-shielded metal-arc welding process. Both No. 3 and No. 20 manual guns and the head for automatic operation are covered, along with wires used in this equipment.

82. Universal Joints

Apex Machine & Tool Co.—There's a size and type of heavy duty universal joint for every aircraft and industrial application shown in 32-page illustrated catalog 27. Guidance in specifying and applying joints for specific devices is provided. Included are application data sheets perforated for easy use.

83. Oxygen & Nitrogen

Air Products Inc.—Tonnage and high-purity type oxygen - nitrogen generators are subject of descriptive 12-page catalog 52 which also points out advantages and illustrates typical installations. Performance data on both types is tabulated. Units can produce up to 2500 and 12,000 cfh, respectively.

84. Timing Relays

Allen-Bradley Co.—Besides having a selection chart for this entire line of timing relays, 16-page illustrated bulletin outlines features, applications, adjustment and operation of each of several types. Bulletin 848, 849, 850 and 852 relays are covered. Engineering data is given.

85. Engine Lubricants

Alpha Corp.—Just how and why Molykote lubricants are effective over a temperature range from far below zero to 750° F are explained in 6-

and equipment

pray rinsed. Cleaner will not attack rubber-tired wheels, painted or plated surfaces, and it can be applied over plastic-coated parts. Whitfield Chemical Co., Dept. ST, 4225 Schaefer Highway, Detroit 17, Mich.

USE REPLY CARD—CIRCLE No. 20

Polyester Laminate Tanks

... no size, shape limits

Tanks and ducts can be fabricated to specification from Iolyte, a fiberglass reinforced polyester laminate. Fabrication is done without use of molds and no size or shape limitation is made. The lightweight

product is a chemical-resistant structural plastic, not a coating. Made without molds, the tanks are not tapered, making the entire area available. Ducts are especially recommended for corrosive fume application. Schori Process Division, Ferro-Co Corp., Dept. ST, 8-11—43rd Rd., Long Island City 1, N. Y.

USE REPLY CARD—CIRCLE No. 21

Inspectable Type Goggle

... with plastic frames

Model 707 spectacle type safety goggle has a plastic frame that is designed to retain safety lens even when subjected to severe impact. Fire core temples have cable-bound ends that permit easy adjustment for a comfortable fit. Pennsylvania Optical Co., Dept. ST, Reading, Pa.

**Reflectoscope
TESTING**

*is available in your plant . . .
AS YOU NEED IT!*

SPERRY INSPECTION SERVICE now makes fast, dependable, non-destructive testing available for every plant. You can have an experienced inspection engineer using a Sperry Reflectoscope — when you need them — for any desired length of time from four hours up.

Take advantage of this opportunity to improve product quality and increase customer acceptance . . . or use a Reflectoscope to eliminate costly down-time for periodic machinery inspections.

Practically every type of material can be tested; hidden defects are quickly and reliably located in up to 30 feet of solid steel. Parts may be checked without dismantling. Write now for complete information.

**KEEP UP-TO-DATE
on the latest testing data**

Use the coupon below to send for your copies of the newest Industrial Application Reports.

ALAN WOOD'S 30" STRIP MILL SERVING YOU SINCE JANUARY 2, 1950

- The Alan Wood 30" continuous mill continues to produce at top speed plates, sheets and strip.

Everything possible is being done to improve our facilities and to expedite production to give you the best possible service.

Remember, too, that Alan Wood's mine-to-mill integrated production line assures you of high grade steel.

Over A Century and a Quarter of Iron and Steel Making Experience

ALAN WOOD STEEL COMPANY

Conshohocken, Pennsylvania

OPEN-ENDING of the Controlled Materials Plan will have little effect on any consumer's steel supplies in the first half of this year.

Open-ending, effective Feb. 13, means that any steel produced in excess of that needed to supply government-authorized allotments to consumers can be sold without regard to allotments. But there likely will be little of this excess steel in the finished forms that are in strongest demand, for there are enough CMP tickets in circulation to sop up all of the hard-to-get items. The products in which there will be "free" steel will be those that already are plentiful.

COVERED—To see how well the carbon steel supply will be covered with CMP tickets, look at the CMP allotments for second quarter. They total 26,168,000 net tons, which is 15 per cent more than the estimated supply of 22,778,000 net tons. The government issues this excess of tickets to make sure there are enough to cover all of the steel that will be produced.

POSSIBILITY—Also suggesting that there will be more than enough tickets to cover all of the hard-to-get steel products is the widely held fear that many steel consumers will insist on buying freely available products, such as wire and wire products, wire rod and small bars, without surrendering their CMP tickets and that they will use their tickets largely to get more of the scarce steel products like heavy shapes, heavy plates, large bars, forging bars, large diameter tubing, and hot-rolled and cold-rolled sheets.

The Office of Defense Mobilization will watch the market conditions closely so that if mills and consumers show a tendency to let the situation get out of hand, remedial measures may be taken.

CONCERNED—Some of the small consumers are concerned as to possible effectiveness of free distribution of steel. They feel they may be at a great disadvantage in obtaining steel because of the pressure the bigger buyers can exert upon producers.

This, however, is not a problem they will run smack up against for a while. Despite any fears they may hold, they have a feeling that a free market will prove to be the better in the long run, even for them.

OPTIMISTIC—How long will steel remain in strong demand? Everyone has been confident it would be strong enough to keep mills producing at capacity during the first half of this year, but there has been a reluctance to make predictions for the second half, and those bold enough to venture an opinion have been inclined to believe demand could not sustain capacity operations. Now, Avery C. Adams, president, Pittsburgh Steel Co., predicts the steel industry will operate all this year at capacity.

FULL TILT—In continuing full operations, the steel industry in the week ended Feb. 21 produced steel for ingots and castings at the rate of 100.5 per cent of capacity. This is a 1-point increase over the preceding week.

With the automobile industry staging a big production push, cold-rolled steel sheets are one of the most sought items. Open-ending of steel distribution increased pressure for this product.

CATCHING UP—Although steel as a whole is in strong demand, there are continuing signs of an approach toward balance between supply and demand in even some of the scarcest products. On the West Coast, weaker demand for merchant bars is spreading to the popular sizes. In some areas of the country, inventories of warehouses, suppliers to the small consumers, are improving gradually as mills become increasingly current on deliveries. Even plates, structurals and bars are in slightly better supply on more sizes.

Decontrol on Feb. 13 of prices of iron and steel scrap brought no immediate change in prices, except on the West Coast where the price structure was further undermined. The market may shape up more definitely within another week. Opinion is mixed as to whether decontrolling of prices will lead to higher prices on prime grades.

NATIONAL STEELWORKS OPERATIONS

DISTRICT INGOT RATES

Percentage of Capacity Engaged at Leading Production Points

	Week Ended Feb. 21	Change	Same Week 1952	Same Week 1951
Pittsburgh	106	- 1*	102	100.5

GAS... THE MODERN FUEL
FOR ALL INDUSTRY

GAS FIRED FURNACES CONSERVE CRITICAL ALLOYS

at SPANG-CHALFANT DIVISION,
The National Supply Company

Continuous Gas-fired heat-treating quench and draw line at Spang-Chalfant plant, Ambridge, Pa. High-heat section brings tubing to temperature required for quench; second section of Gas-fired furnaces performs draw, or tempering operations.

PHYSICAL PROPERTIES FOR N-80 CASING

MINIMUM YIELD STRENGTH... 80,000 PSI.
MINIMUM ULT. TENSILE ST... 100,000 PSI.
MINIMUM ELONG. IN 2".....16%

ANALYSIS OF STEEL BEING USED

CARBON.....0.30 TO 0.40
MANGANESE.....0.60 TO 0.90
PHOSPHOROUS.....0.04 MAX
SULFUR.....0.05 MAX
SILICON.....0.25 MAX

- In production of more than 80,000 tons of deep oil-well casing, critical alloys have been saved as follows:
- over 300,000 pounds molybdenum
- almost 1,500,000 pounds manganese

For five years, plain carbon steel has been used at Spang-Chalfant Division of The National Supply Co. to make deep oil-well casing, grade N-80. Usually this casing is made with normalized-and-drawn high Mn-Moly steel. This new process gives the necessary characteristics to the casing by means of continuous Gas-fired heat-treating quench and draw line.

Physical properties of the steel show it to be at least equal to the high Mn-Moly casing formerly made.

The heating units, designed by Selas Corporation of America, are composed of twelve radiant Gas-fired furnaces, divided into two sections of six furnaces each. First section brings pipe to quenching temperature of about 1600° F. Second section maintains temperatures of 1050 to 1250° F, depending upon the metallurgical structure of the pipe. Other equipment includes eight carburetors which

deliver pre-mixed fuel under pressure to burners, automatic temperature control and recording devices, annular orifice quench head with pumping and filtering equipment.

Two rows of Gas burners on each side of these furnaces permit extremely fast heating. Ceramic burner tips can be replaced while the furnace is operating.

Gas is Industry's modern, efficient fuel. Wherever you need Heat, you need Gas. Get the facts from your Gas Company Representative.

METAL POWDERS

Per pound, f.o.b. shipping point in ton lots for minus 100 mesh, except as otherwise noted)	
Sponge iron:	Cents
98-4% Fe, annealed	18.00
Unannealed	14.50
Swedish, c.i.f. N.Y., c.l., in bags	10.90
Electrolytic iron:	
Annealed, 99.5% Fe.	42.50
Unannealed (99+ % Fe)	36.50
Unannealed (99+1% Fe) (minus 325 mesh)	53.50
Powder Flakes	43.50
Carbonyl iron:	
97-99.8% size 5 to 10 microns	\$3.00-143.00
Aluminum:	
Cast, freight allowed	31.00
Atomized, 500 lb drums, freight allowed	33.00
Antimony, 500 lb lots	71.00
Brass, 20-ton lots	31.00-34.25
Bronze, 10-ton lots	51.25-60.00
Phosphor-Copper, 20-ton lots	50.00
Copper:	
Electrolytic	37.25
Reduced	35.25
Lead	7.50*
Magnesium	75.00-85.00
Manganese:	
Minus 100 mesh	57.00
Minus 35 mesh	52.00
Minus 200 mesh	62.00
Nickel unannealed	86.00
Nickel-Silver 5-ton lots	46.00
Silicon	38.50
Solder	8.50*
Stainless Steel, 302	33.00
Zinc, 10-ton lots	18.00-31.00
Tungsten	Dollars
Melting grade, 99% 80 to 200 mesh:	
1000 lb and over	5.85
Less than 1000 lb	6.00
Molybdenum:	
99.9%, minus 200 mesh	3.24
Chromium, electrolytic 99% Cr min.	3.50

* Plus cost of metal.

"she might have been my kid..."

"There was no time to stop, see? She comes running out from behind this parked car right under my wheels. Her hair is in pig-tails, and with the sun shining on it, she might have been *my* kid. We got her to the hospital. It took 3 pints of blood to bring her around. All I have to do is remember the sound of those screaming tires—and I know

why I'm giving blood."

Yes, all kinds of people give blood—truck drivers, office workers, salesmen. And—for all kinds of reasons. But whatever *your* reason, this you can be sure of: Whether your blood goes to a local hospital, a combat area or for Civil Defense needs—this priceless, painless gift will some day save an American life!

Business Executives!

✓ Check These Questions!

If you can answer "yes" to most of them, you—and your company—are doing a needed job for the National Blood Program.

- ☐ Have you given your employees time off to make blood donations?
- ☐ Has your company given any recognition to donors?
- ☐ Do you have a Blood Donor Honor Roll in your company?
- ☐ Have you arranged to have a Bloodmobile make regular visits?
- ☐ Has your management endorsed the local Blood Donor Program?
- ☐ Have you informed your employees of your company's plan of co-operation?
- ☐ Was this information given through Plant Bulletin or House Magazine?
- ☐ Have you conducted a Donor Pledge Campaign in your company?
- ☐ Have you set up a list of volunteers so that efficient plans can be made for scheduling donors?

Remember, as long as a *single* pint of blood may mean the difference between life and death for *any* American . . . the need for blood is *urgent*!

Give Blood Now

CHROMIUM ALLOYS

High-Carbon Ferrochrome: Contract, c.l. lump, bulk 24.75c per lb of contained Cr; c.l., packed 25.65c, ton lot 26.80c, less ton 23.20c. Delivered. Spot, add 0.25c.

Low-Carbon Ferrochrome: (Cr. 67-72%) Contract, carload, lump, bulk, max. 0.03% C 37.60c per lb of contained Cr. 0.04% C 35.50c. 0.06% C 34.50c. 0.10% C 34.00c. 0.15% C 33.75c. 0.20% C 33.50c. 0.50% C 32.25c. 1% C 33.00c. 1.50% C 32.85c. 2% C 32.75c. Carload packed add 1.1c, ton lot add 2.2c, less ton add 3.9c. Delivered. Spot, add 0.25c.

Foundry Ferrochrome, High Carbon: (Cr. 62-66%, C 5-7%) Contract, c.l. 8 M x D, bulk, 26.25c per lb of contained Cr. c.l., packed 27.15c, ton 28.50c, less ton 30.25c. Delivered. Spot, add 0.25c.

Foundry Ferrochrome, Low Carbon: (Cr 50-54%, Si 28-32%, C 1.25% max.) Contract, carload, packed, 8 M x D, 18.35c per lb of alloy; ton lot 19.2c, less ton lot, 20.4c, delivered; spot, add 0.25c.

Low-Carbon Ferrochrome Silicon: (Cr 34-41%, Si 42-49%, C 0.05% max.) Contract, carload, lump, 4" x down and 2" x down, bulk, 25.75c per lb of contained chromium plus 12.4c per pound of contained silicon; 1" x down, bulk 25.90c per pound of contained chromium plus 12.60c per pound of contained silicon. F.o.b. plant; freight allowed to destination.

Ferrochrome Silicon, No. 2: (Cr 36-39%, Si 26-39%, Al 7-9%, C 0.05% max.) 25.75c per lb of contained silicon plus 16.4c per lb of contained silicon plus aluminum 3" x down, delivered.

Chromium Metal: (Min 97% Cr and 1% Fe) contract carload, 1" x D; packed, max 0.50% C grade, \$1.12 per lb of contained chromium ton lot \$1.14, less ton \$1.16. Delivered. Spot, add 5c; prices on 0.10 per cent carbon grade, up 4c.

SILICON ALLOYS

25-30% Ferrosilicon: Contract, carload, lump, bulk, 20.0c per lb of contained Si; packed 21.40c; ton lot 22.50c, f.o.b. Niagara Falls, freight not exceeding St. Louis rate allowed.

50% Ferrosilicon: Contract, carload, lump, bulk, 12.40c per lb of contained Si, carload packed 14.0c, ton lot 15.45c, less ton 17.1c. Delivered. Spot, add 0.45c.

Low-Aluminum 50% Ferrosilicon: (Al 0.40% max.) Add 1.3c to 50% ferrosilicon prices.

75% Ferrosilicon: Contract, carload, lump, bulk, 14.3c per lb of contained Si, carload

NOTE: Current prices on manganese, titanium and "other ferroalloys" appeared on page 147 Feb. 16 issue; calcium, zirconium, briquetted alloys and refractories, page 115, Jan. 26.

packed 15.6c, ton lot 16.75c, less ton 18.0c. Delivered. Spot, add 0.8c.

90-95% Ferrosilicon: Contract, carload, lump, bulk, 17.0c per lb of contained Si, carload packed 18.2c, ton lot 19.15c, less ton 20.2c. Delivered. Spot, add 0.25c.

Silicon Metal: (Min 97% Si and 1% max Fe) C.l. lump, bulk, regular 18.5c per lb of Si, c.l., packed 19.7c, ton lot 20.6c, less ton 21.6c. Add 0.5c for max. 0.10% calcium grade. Deduct 0.5c for max 2% Fe grade analyzing min 96% Si. Spot, add 0.25c.

Alsilfer: (Approx. 20% Al, 40% Si, 40% Fe) Contract, basis f.o.b. Niagara Falls, N. Y., lump, carload, bulk, 9.90c per lb of alloy, ton lots packed 11.30c, 200 to 1999 lb 11.65c, smaller lots 12.15c.

VANADIUM ALLOYS

Ferrovanadium: Open-hearth Grade (V 35-55%, Si 8-12% max, C 3-3.5% max.) Contract, any quantity, \$3.10 per lb of contained V. Delivered. Spot, add 10c. Crucible-Special Grades (V 35-55%, Si 2-3.5% max, C 0.5-1% max), \$3.20. Primos and High Speed Grades (V 35-55%, Si 1.50% max, C 0.20% max) \$3.30.

Grainal: Vanadium Grainal No. 1, \$1 per lb; No. 6, 68c; No. 79, 50c, freight allowed.

Vanadium Oxide: Contract, less carload lots \$1.23 per lb contained V₂O₅, freight allowed. Spot, add 5c.

BORON ALLOYS

Ferroboreon: B 17.50% min, Si 1.50% max, Al 0.50% max, C 0.50% max.) Contract, 100 lb or more, 1" x D, \$1.20 per lb of alloy. Less than 100 lb \$1.30. Delivered, spot, add 5c. F.o.b. Washington, Pa., prices, 100 lb and over, are as follows: Grade A (10-14% B) 75c per pound; Grade B (14-18% B) \$1.20; Grade C (19% min B) \$1.50.

Borosi: (3 to 4% B, 40 to 45% Si), \$5.25 per lb contained B, delivered to destination.

Bortam: (B 1.5-1.9%). Ton lots, 45c per lb; smaller lots, 50c per lb.

Carbortam: (B 1 to 2%) contract, lump, carloads 9.50c per lb, f.o.b. Suspension Bridge, N. Y. freight allowed same as high-carbon ferrotitanium.

TUNGSTEN ALLOYS*

Ferrotungsten: (70-80%), 10,000 lb W or more, \$4.85 per lb of contained W; 2000 lb W to 10,000 lb W, \$4.95; less than 2000 lb W, \$5.07, f.o.b. Niagara Falls, N. Y.

* Government ceiling prices, effective May 7, 1951, f.o.b. Niagara Falls, N. Y., basis.

LEADERS IN IRON AND STEEL SCRAP SINCE 1869

make sure you get full value for your belt conveying dollar

Here's Why:

1. The supporting brackets are unbreakable in normal operation. They remain rigidly tight and will stand abnormal usage without breaking.
2. The bearing mountings maintain positive bearing alignment under all conditions.
3. Rex Idlers have positive and permanent bearing protection against dust and dirt, and require minimum service attention . . . once every 1000 hours in normal operation.
4. Rex Idlers have high grade, precision, antifriction bearings with ample radial and thrust load capacity. This means lowest power consumption under all conditions.
5. The roll shells are of permanent unit construction with no joints to loosen or corrode. No replacements until idler is completely worn out.
6. The idler rolls are smooth and concentric and spaced in the idler assembly to protect the underside of the belt. The roll units are interchangeable for easy servicing.

If your idlers have all these features, you're getting the most for your idler dollar . . . you're using Rex Idlers. If you're using any other idler, it can't possibly have all these outstanding features . . . you can't be getting lowest possible cost per ton handled on your belt conveyor.

So, if you haven't yet standardized on Rex Idlers, call your nearest Chain Belt Field Sales Engineer. He'll give you all the details. Or, if you prefer, write for Bulletin 51-81. Chain Belt Co., 4660 W. Greenfield Ave., Milwaukee 1, Wis.

STEEL

Piecemeal arrival of price decontrol on nonferrous metals causes maladjustments and throws secondary metals industry into a dither

AFTER MONTHS of clamoring for price decontrol, the secondary metals industry was thrown into a dither when it did come. Though prepared for the event, the industry wasn't expecting it to come piecemeal.

Rub is that lids on primary metals were not lifted at the same time. The turmoil won't subside until this is done. Pulling out of price stakes of all but the most critical metals is expected at any time. Action in copper is especially necessary as the only logical answer to a ludicrous situation.

Farcical Facts—Secondary copper, on the basis of raw material costs, is now worth more than primary metal from domestic producers. No firm prices have been posted yet and orders for the most part call for price at time of shipment.

Ceilings on primary copper that doesn't contain more than 25 per cent scrap are still frozen at 24.50 cents a pound. Those using more than 25 per cent scrap have no controls to contend with. More interest is being shown in contracting for deliveries in the third and fourth quarters. Several nibbles have been reported at prices up to 32 cents a pound.

Down the Line — In addition to scrap, some metals not threatening ceilings also added to the decontrol list. They include lead, zinc, tin, magnesium, antimony, cadmium and other minor metals.

Pressure for ending of all CMP authority before June 30 won't have substantial results. Some supply protection for defense fabricators must be maintained, according to Washington officials, and the open-end set-up is the least objectionable way. Some form of controls is needed to protect small consumers' positions on mill schedules, they believe.

No Ticket Needed—Placing of un-rated orders for CMP products after expiration of normal lead times is now allowed. You have to find a mill with open space on its books though. Metal for March and April delivery can be placed now. For May delivery, you can try to place orders after Mar. 15, for June deliveries after Apr. 15. Don't count on placing any orders until May at least.

Aluminum mill product deliveries,

for example, are about 60 days late on scheduled month. Orders placed now for sheet, plate or extrusions couldn't be delivered till third quarter. Space exists for forgings at present though. Pressure on brass mills has eased slightly, and warehouse stocks are showing improved product mix.

Scrap Prices Move Up

In the first week of decontrol, refiners' buying prices of No. 1 copper scrap moved up 5½ to 6½ cents, indicating a selling price of refined metal of over 30 cents. One deal reportedly made last week was for a good tonnage of No. 1 copper scrap at 31 cents. Most dealers and buyers can't get together pricewise yet, though. Brass mills, ingot manufacturers and foundries are still under allocation as required by M-16, and may be continued under it until June. Scrap conversion arrangements between refiners and dealers under M-16 must now have NPA approval, and shipments from dealers to refiners under prior contracts that didn't require NPA permission must be completed by Feb. 28.

Zinc Market Weaker

Zinc markets are again unsteady with a further easing in London prices and lack of buying interest here. A further price dip is in the offing unless more customers can be induced to place orders. Lead is steady but slow, a price reversal is not in the cards here though. As effect of mine closings is felt, a tightening in supply and a firming in price can be expected.

Stockpile Up \$2.4 Million

Strategic materials valued at \$2.4 million went into the nation's stockpile in the last six months, the Munitions Board says. Inventory at end of 1952 was valued at more than \$4 billion on basis of current prices, and

the goal is about 78 per cent completed on a dollar basis. Goals are yet to be reached in bauxite, cadmium, copper, lead, zinc, manganese, mercury, platinum, tin and vanadium. Goals have been met in antimony, bismuth, fluorspar and iridium. Expansion programs under way are expected to provide the stockpile with aluminum, antimony, bauxite, beryl, cadmium, chromite, cobalt, columbite, tantalite, copper, fluorspar, lead, magnesium, manganese, mercury, molybdenum, nickel, platinum, rutile, tin, tungsten and zinc.

Nonferrous Briefs

Producers of beryllium-copper-base alloys were given authority to raise prices an average of 11 per cent over former ceilings.

International Materials Conference discontinued primary copper allocations for the January-March period and probably forever.

Between the known views of Treasury Secretary Humphrey and legislation to be introduced by Senator Byrd of Virginia, RFC looks like a dead duck.

Inventory restrictions on brass mill product distributors have been eased. Distributors may immediately replace materials sold rather than wait until the following month.

Zinc stocks rose slightly to 88,475 tons going into February. January production edged up to 81,994 tons, reports the American Zinc Institute. After shipments during January of 80,679 tons, unfilled orders stood at 39,732 tons.

General Motors Fabricast Division is putting up a new 100,000-square-foot aluminum foundry at Jones Mills, Ark., to turn out permanent mold castings for torque converter transmissions and several other automotive parts.

Harvey Machine Co. got Interior department approval of a contract for combination firm and interruptible power from Bonneville Power Administration to supply its new aluminum reduction plant at The Dalles, Ore.

Magma Copper Co. bought up the Tiger, Ariz., properties of St. Anthony Mining & Development Co., which adjoin Magma's huge new low-grade copper ore body development.

Kaiser Aluminum & Chemical Co.'s \$12-million Jamaica bauxite operation got under way last week as a 10,000-ton shipment was loaded for processing at Baton Rouge, La.

NONFERROUS METALS

(Cents per pound, carlots, except as otherwise noted)

Primary Metals

Copper: Electrolytic 24.50c, Conn. Valley; Lake 24.62½c, delivered.

Brass Ingots: 85-5-5-5 (No. 115) 27.25c, 88-10-2 (No. 215) 40.00c; 80-10-10 (No. 305) 33.00c; No. 1 yellow (No. 405) 23.25c.

Zinc: Prime western 11.50c; brass special 11.75c; intermediate 12.00c; East St. Louis; high grade 12.85c, and special high grade 13.00c, delivered.

Lead: Common 13.30c; chemical 13.40c; cor-rod, 13.40c, St. Louis.

Primary Aluminum: 99% plus, ingots 20.50c, pigs 19.50c. Base prices for 10,000 lb and over. Freight allowed on 500 lb or more but not in excess of rate applicable on 30,000 lb c.l. orders.

Secondary Aluminum: Piston alloys 20.50c nom.; No. 12 foundry alloy (No. 2 grade) 22.50c; steel deoxidizing grades, notch bars, granulated or shot: Grade 1, 22.00c; grade 2, 21.50c; grade 3, 21.25c; grade 4, 21.00c.

Magnesium: Commercially pure (99.8%) stand-ard ingots, 10,000 lb and over 24.50c, f.o.b. Freeport, Tex.

Tin: Grade A, prompt 121.50c.

Antimony: American 99-99.8% and over but not meeting specifications below 34.50c; 99.8% and over (arsenic 0.05% max., other impuri-ties 0.1% max.) 35.00c; f.o.b. Laredo, Tex., for bulk shipments.

Nickel: Electrolytic cathodes, 99.9%, base sizes at refinery, unpacked, 60.00c; 25-lb pigs, 62.65c; "XX" nickel shot, 63.65c; "F" nickel shot or ingots, for addition to cast iron, 60.00c. Prices include import duty.

Mercury: Open market, spot, New York, \$205-\$206, per 76-lb flask.

Beryllium-Copper: 3.75-4.25% Be, \$1.595 per lb of alloy, f.o.b. Reading, Pa.

Cadmium: "Regular" straight or flat forms, \$2 del; special or patented shapes \$2.15.

Cobalt: 97.99%, \$2.40 per lb for 500 lb (kegs); \$2.42 per lb for 100 lb (case); \$2.47 per lb under 100 lb.

Gold: U. S. Treasury, \$35 per ounce.

Silver: Open market, New York 85.25c per oz.

Platinum: \$90-\$93 per ounce from refineries.

Palladium: \$23-\$24 per troy ounce.

Iridium: \$175-\$185 per troy ounce.

Titanium (sponge form): \$5 per pound.

Rolled, Drawn, Extruded Products

COPPER AND BRASS

(Ceiling prices, cents per pound, f.o.b. mill, effective July 1, 1952)

Sheet: Copper 45.52; yellow brass 40.17; com-mercial bronze, 95% 45.15; 90% 44.38; red brass, 85% 43.10; 80% 42.34; best quality, 41.35; nickel silver, 18%, 56.08; phosphor-bronze grade A, 6%, 64.71.

Rod: Copper, hot-rolled 41.37; cold-drawn 42.42; yellow brass free cutting, 33.85; com-mercial bronze 95% 44.34; 90% 44.07; red brass 85%, 42.79; 80%, 42.03.

Seamless Tubing: Copper 45.66; yellow brass 43.18; commercial bronze, 90%, 47.04; red brass, 85%, 46.01.

Wire: Yellow brass 40.46; commercial bronze, 95%, 45.44; 90%, 44.67; red brass, 85%, 43.39; 80%, 42.63; best quality brass, 41.64.

(Base prices, effective July 1, 1952)

Copper Wire: Bare, soft, f.o.b. eastern mills, 100,000 lb lots, 32.795; 30,000 lb lots, 32.92; l.c.l., 33.42. Weatherproof, 100,000 lb, 33.60; 30,000 lb, 33.85c; l.c.l., 34.35. Magnet wire del., 15,000 lb or more, 38.76; l.c.l., 39.50.

Full annealing, isothermal annealing, or any similar heat-treatment can be handled economically in this 1650 F High-Temperature Homo Furnace.

Machinability

of "Pexto" Tool Forgings
is Increased by
Homo High-Temperature Annealing

• Securing strong, tough, yet easily machinable forgings for "Pexto" adjustable angle wrench bars and jaws depends upon quality annealing. And in the Peck, Stow & Wilcox plant at Southington, Conn., they use the Homo Method to supply the desired results.

With Homo equipment, machinability is assured because *every* forging is uniformly annealed to specification . . . unexpected hard or soft spots in the forgings are not encountered in subsequent machining operations.

CUTS TIME IN HALF The High-Temperature (200-1650 F) Homo in this plant also cuts annealing time by 50% over the box-annealing method formerly used. Instead of pack-annealing for 20 hours, the parts are now heated for only 10 hours. All the labor of packing and unpacking is saved . . . a big item, because a furnace charge weighs almost two tons. With the Homo method, the furnace charge requires no attention during heating, other than to drop the temperature control point if a program anneal is desired. There are no rejects due to anneal.

Wire . . .

Wire Prices, Page 151

Boston—Except for a few products, upholstery spring wire and automotive volume included, orders are being taken for April-May, indicating broader distribution available for second quarter. For automobile assembly an increase of 20 per cent during the April-June period is projected and, if this objective is met, additional "free" tonnage for distribution will be correspondingly reduced from mills supplying that industry.

New York—How much open-end wire tonnage will be available for second quarter is problematical, but for some products, not booked beyond April, supply will go far toward balancing demand. Wire products required for automobile output are excluded.

Sheets, Strip . . .

Sheet and Strip Prices, Page 149 & 150

Boston—Open-ending of steel distribution has increased pressure for procurement, notably for cold-rolled sheets. Except for galvanized and narrow carbon strip little, if any, additional commercial tonnage will be available for second quarter. Straight chromium stainless narrow strip schedules are filled, reflecting heavy automotive demand and to some extent requirements for stainless electric welded tubing.

New York—Some smaller sheet consumers fear they will be at a disadvantage, compared with the larger, especially those identified with the automotive industry, once the recent open-ending of CMP allotments has an opportunity to become effective in actual practice. They doubt the situation will be put to a real test until the mills begin opening their books for third quarter, as they appreciate the fact producers generally are well booked for the entire second quarter.

Philadelphia—While sheet consumers generally welcome decontrol, some smaller sheet buyers wonder if they will fare as well in a free and open market as they have under the Controlled Materials Plan. Bigger and more important buyers can exert more pressure on the mills and upon occasion to the disadvantage of smaller consumers.

Pittsburgh—Pressure on the mills for hot and cold-rolled sheets will continue into third quarter. Pressing hardest for tonnage are consumer durable goods manufacturers who are hoping open-ending of CMP will make available to them a little more steel.

Cleveland—Decontrol of distribution is not expected to result in much change in tight sheet supply conditions over coming weeks. The mills are pretty well booked up through second quarter and allocations for the period must be honored. As a result, little so-called free steel will be available before third quarter. Even then, there is no certainty much additional tonnage will be available in the open market since the steel-makers still will be faced with the necessity of giving priority to mili-

tary and defense needs. Further, there is no indication that the mills will be relieved of the tonnage burden on them in the form of directives, such as in the case of sheet mills, of light plate tonnage which they are compelled to roll at the expense of sheet production.

Chicago—Open-ending of CMP hasn't altered the situation insofar as sheets are concerned. Facilities are fully committed through second quarter and numerous consumers report they haven't been able to place all their tickets. The cold-rolled sheet situation has been combed over by automakers and the guess is this may be the limiting factor in car assembly in second quarter.

See More Export Steel

New York—With the decontrolling of steel, a freer supply of tonnage for export is expected to develop eventually but exporters doubt if supply will ease much before beginning of second half.

At present, the Office of International Trade obtains allotments through the National Production Authority and issues licenses against these allotments. Actual licensing may continue for considerable time so as to make sure tonnage sold goes to "friendly" countries and that there are no shipments of critical items required for this country's defense needs.

A greater tonnage of steel for export, however, will undoubtedly become available and should be reflected in freer offerings within the next two to three months for shipment in third quarter.

Steel Bars . . .

Bar Prices, Page 149

Boston—Only in small sizes will additional commercial volume of carbon bars be available for second quarter, mostly in May-June schedules. Alloys and cold-finished 1½-inch and over are booked well through the period. Shell program is taking large part of production of larger cold-drawn. Inventories in smaller sizes are heavier. This accounts for easing in pressure from forge shops. Deliveries to forge shops have been heavy since the mills caught up on delinquent orders. First large shell contract has been placed in this area, \$11 million for 155-millimeter, with New Bedford Defense Products, subsidiary of Firestone Tire & Rubber Co.

New York—Open-ending of the Controlled Materials Plan will have little bearing on bar distribution in first half. All CMP tickets will take preference throughout the period and as most mills are already confronted with more of these tickets than they can handle, there is little likelihood of "free" tonnage being available for delivery before July.

Philadelphia—Cold bar drawers say they have been receiving an increasing number of uncertified inquiries since open-ending action by Washington recently. They will be able to accept some for shipment before end of second quarter. Much

will depend upon availability of hot bar stock. Until fairly recently some cold drawers have been accepting far more defense work than quotas called for. This work does not now appear so pressing and cold-drawers are more disposed to cut down on acceptances when possible so as to be in better position to service their regular trade.

Pittsburgh—Users of hot-rolled bars report deliveries are more current and in a better range of sizes. Not all the tonnage they would like in large diameters is being received, but inventories are approaching balance.

Cleveland—Consumers of large-size bars are not "kidding" themselves that open-ending of the Controlled Materials Plan will result in an early improvement in supply conditions. Actually, it is believed that so long as military and defense needs continue heavy, the pattern of distribution will remain pretty much as it has over past months. Of course, the barmakers will have a little more leeway in booking orders in the closing months of the year, but as things stand today there is little chance much open space in rolling schedules will appear before third, possibly fourth quarter.

Chicago—Barmakers can't see that consumers stand to gain this quarter and next by the CMP open-ending. Rolling schedules are completely filled through second quarter and there are still tickets for this period to be cashed.

Tubular Goods . . .

Tubular Goods Prices, Page 153

New York—Reflecting reduction in the price of zinc, the United States Steel Export Co. has made the following revisions in export base prices with freight included to New York, Philadelphia and Baltimore, effective with shipments from producing mills Feb. 4, 1953:

American standard pipe, t & c, galvanized butt weld 2½ and 3 inches, 17.65 per cent discount; galvanized seamless 2 inches, 2.65 per cent discount; 2½ and 3 inches, 4.15 per cent discount; 3½ and 4 inches, 6.15 per cent discount; 5 and 6 inches, 10.90 per cent discount.

English gas tubes, galvanized butt weld 2½ and 3 inches, 19.55 per cent discount.

Galvanized plain wire, \$6.645 per 100 pounds. Galvanized barbed wire—Lyman 4 pt, 5 in., \$6.73 for 80 rod spool.

Boston—No longer are butt weld and light wall carbon electric tubing in short supply. With wrought iron pipe, supply is in balance with demand. Distributors are not taking all butt weld offered for April-May and prices at secondary level are easier.

Tin Plate . . .

Tin Plate Prices, Page 150

Pittsburgh—Tin plate producers who first estimated a weak second quarter in the offing are now taking a second look. From all indications, second quarter will be booked full. Relaxation of controls is a factor.

"... More than 50% of our employees are on the Payroll Savings Plan ..."

PAUL W. JOHNSTON
President, Erie Railroad

"We on the Erie Railroad are extremely proud that 50% of our employees are on the Payroll Savings Plan for U.S. Defense Bonds. These thousands of employees are regularly providing for their own future security and at the same time contributing to the strength of our national defense. The American habit of thrift and regular purchase of U.S. Defense Bonds Shares in America are evidences of good, sound citizenship."

Good, sound citizenship . . . the American habit of thrift . . . a belief that a strong America is a secure America . . . a management that makes the Payroll Savings Plan available to *all* its employees—these are the reasons why more than 50% of Erie Railroad employees are enrolled in the Payroll Savings Plan.

For the same four reasons, more than 7,500,000 employed men and women in thousands of other companies are active members of the Payroll Savings Plan—their take-home savings in the form of U.S. Defense Bonds total more than \$150,000,000 per month.

Is your company in the "more than 50% participation" group? If it isn't, please bring this page to the attention of your top executive. Point out to him—

Two Simple Steps to a Successful Payroll Savings Plan

1. Phone, wire or write to Savings Bond Division, U.S. Treasury Department, Suite 700, Washington Building, Washington, D. C.
2. Your State Director, Savings Bond Division, will show your company how to conduct a simple person-to-person canvass that will put a Payroll Savings Application Blank in the hands of *every* employee.

That is all management has to do. Your employees will do the rest. They, like the employees of the Erie Railroad, want to provide for their personal security and at the same time do their part in helping to keep America strong.

The United States Government does not pay for this advertisement. It is donated by this publication in cooperation with the Advertising Council and the Magazine Publishers of America.

ELECTRONIC CRANE SCALE

for heavy industrial
weighing and remote
recording

REDUCES INSTALLATION COSTS! Entire assembly ready to attach to crane or hoist. Only a cable connection is run from Baldwin Load Cell to remote recorder.

REDUCES OPERATING COSTS! Great savings in time and man power are possible because weighing and transporting operations are combined. Scale is easily removed from crane whenever desired.

REDUCES MAINTENANCE COSTS! The only element subjected to weight is the sturdy load cell, which can be easily replaced or interchanged.

Remote Recorder
prints exact weight
on tape, tickets or
cards!

KARDONG CIRCLE BENDER

For Concrete Reinforcing Bars

This is a powerful and fast machine for heavy duty work in both fabricating plants or in the field where large tonnage is required. It will handle as high as 20 tons a day. Circles of any size required in concrete reinforcing work from 18 inches in diameter up can be bent on this machine. It will bend bars with two or more radius on the same bar without stopping the machine.

Made in two sizes
Model "C" Capacity 1 1/4 inch
Model "CA" Capacity 1 inch
Write for catalog of our complete line of reinforcing bar benders.

KARDONG BROTHERS, INC.

Chicago Office: 333 North Michigan Ave., Chicago, Ill.

Plates . . .

Plate Prices, Page 149

New York—Plate consumers see little early supply relief as result of the open-ending of CMP. Tickets will be given preference throughout the remainder of this half and tonnage covered by these tickets is heavier than most mills can handle. However, with elimination of all tickets except those carrying magic numbers for third quarter and beyond (unless there is some unexpected upheaval in the international situation) the great bulk of tonnage booked from perhaps April on will be of "free" character, as mills generally open books for the succeeding quarter around 60 to 90 days in advance.

Boston—If more commercial plate tonnage is available in second quarter it will be in narrow sizes and gauges. Warehouses and most consumers are getting filled up, and with controls relaxed, some strip-mill plate capacity may be returned to sheet production.

Philadelphia—Plate production is expected to be sustained at high level throughout first half turning out rated work. Little, if any, "free" tonnage will be available during that period as a result of the recent open-ending action by NPA. Nor will there be much change in the type of plate produced so long as demand holds up, as production directives have already been set up for the remainder of the half and continue valid.

Pittsburgh—Demand for lighter gauge plates will continue through second quarter. First sign of easier plate market situation is expected in the lighter plates. Deliveries are currently good.

Seattle—Small fabricators continue handicapped by limited plate supplies although some interests report conditions are improving.

Structural Shapes . . .

Structural Shape Prices, Page 149

Philadelphia—Fabricators are getting caught up a little on backlogs. Most of the larger shops now have more than 6 to 7 months work on hand, and the smaller plants no more than 3 to 4 months. However, with spring not too far off, there may be a seasonal spurt in building activity which will at least sustain backlogs, if not increase them.

Boston—Inventories of most fabricating shops are substantial. Lacking are specific sizes, representing minor, but needed tonnage for completion of work in progress. Some are making up deficiencies with foreign steel and from warehouse, although stocks with the latter are also unbalanced.

New York—A slight increase is noted in commercial building, but major demand is still for publicly financed projects, notably bridge work. The larger fabricating shops are booked months ahead as they are in position to profit most by bridge demand and numerous large public projects of other character.

Cleveland—Structural fabricators anticipate a substantial volume of business this year. They expect steel

supply will show gradual improvement as the months pass. Building activity is described as better than normal for this season, this being explained by the open weather that has prevailed generally throughout the area this winter. Competition is keen for small jobs currently coming out, and price cutting of as much as \$20 per ton erected is reported.

Chicago—It is too early to tell whether open-ending of CMP will help building construction. Odds are it is going to get little additional steel in first half because output of the structural mills is fully booked for this term.

Scrap . . .

Scrap Prices, Page 156

Buffalo—With a top buyer of steel-making grades of scrap placing new orders at the former government ceiling prices, lifting of controls has had little effect on the market here. The buying mill is permitting dealers to ship at top prices until Mar. 1. Price ranges, however, on top grades are fixed with a 50 cent range, the inside figure being below the ceiling. The cast market continues weak with prevailing prices \$4 to \$5 under former control levels.

Boston—Steel scrap prices are not expected to rise with customers' inventories comfortable. Some buyers attribute recent purchasing for Morrisville, Pa., as sustaining prices on several grades. Consumers are taking shipments at the current rate of consumption.

New York—Scrap brokers' buying prices are unchanged at former OPS levels pending working off of various contracts. Market may begin to shape up more definitely within another week.

Philadelphia—Decontrolling of scrap prices has resulted in no change. Major grades are quoted at the same levels and on the same basis as heretofore. However, a trend toward reestablishment of historical differentials, such as have prevailed particularly in some of the steelmaking grades, is expected to set in shortly, with eventually all grades of scrap being quoted in this district on a delivered basis.

Pittsburgh—Decontrol of scrap prices has brought trading to a standstill. Old orders are moving at the former ceiling levels. Mills have good inventories and are content to sit back and await price developments.

Cleveland—Removal of government price control has served to inject a high degree of uncertainty into the scrap market with respect to the actual level of current prices. With buying at a virtual standstill, dealers are inclined to await developments. For the most part it appears that former ceilings are holding on the steelmaking grades with the blast furnace and cast grades continuing to display weakness. Expectations are that when the situation clarifies the steel grades will tend to advance, especially quality material.

Youngstown—Local steel mills, operating at the highest sustained rate in history, are virtually out of the scrap market. They are working off inventories accumulated during and since the steel strike last summer.

Chicago—Although lifting of iron and steel scrap price control had not been expected so soon, such action on Feb. 12 brought no reaction here. A week after decontrol the market remains untested. Some adjustments in steelmaking grades are probable and it is expected normal differentials will be restored. Mills have about 60 days' inventories and receipts against old contracts fairly well balance consumption. Weather is favorable to improvement in future supplies. In view of this, new buying and consequent establishment of price levels will come in orderly fashion.

St. Louis—Majority of scrap prices stuck to ceiling in this district after decontrol. Main exceptions were rails and axles, currently the scarcest item in the market. Turnings and borings dropped \$1 to \$2 below ceiling. Mills have told brokers they will deal, for the moment, on the basis of ceilings and no effort has been made to trim prices on outstanding orders. No new ones are being placed, however, and mills seem in no haste to do so, although generally their daily consumption is a trifle over their receipts. Speculation on the course of railroad scrap prices holds the market's interest. Missouri Pacific and MKT were to make the first post-decontrol offerings and, for the first time since lists were routed through Washington for allocation, mailed dealers invitations to bid. There is sentiment among melting steel consumers to reestablish a No. 1 grade of firm quality even at a premium price. They also want to push No. 2 bundles down, with a \$1 or \$2 differential.

Los Angeles—Removal of price controls has further undermined the scrap price structure in this district. Dealers are quoting the following prices: No. 1 heavy melting \$2 lower to \$30, No. 2 heavy melting \$1 less to \$26, No. 1 bundles off \$4 to \$29, No. 2 bundles down \$3 to \$24. Machine shop turnings remain at \$12.

San Francisco—No. 1 heavy melting scrap dropped \$4 a ton to \$30 last week, falling away from the ceiling price for the first time as the whole price structure cracked. No. 1 bundles also dropped \$4 to \$29 a ton delivered. Other declines were \$1 a ton for No. 2 heavy melting to \$26 and \$3 for No. 2 bundles to \$24. Turnings remained unchanged at \$12 a ton. No. 1 cupola cast weakened \$1 to \$39. Scrap is plentiful.

Seattle—Decontrol of scrap prices is not expected to greatly change market conditions in this area. Supplies are ample for current needs, with material offered better than average. From remote points Coast buyers will absorb up to \$8.50 extra freight costs. Prices quoted here are: No. 1 heavy melting, \$34; No. 2 heavy, \$29; No. 1 bundles, \$33; No. 2 bundles, \$27; unstripped motor blocks, \$29; rails \$39.

Fasteners . . .

Bolt, Nut, Rivet Prices, Page 155

Pittsburgh—Bolt and nut producers report a brighter outlook for second quarter than they expected

several weeks ago. They have some first quarter open space. Over-all, however, they predict comfortable demand through June.

Pig Iron . . .

Pig Iron Prices, Page 148

Chicago—Foundry operations are the best they have been in months but they are still spotty. Some gray iron and malleable shops lack orders to work full weeks. It is reduced volume from the agricultural implement industry that is causing most of the irregularity. Pig iron supply is meeting current demand.

Boston—Melters of foundry and basic pig iron will go through the winter without serious supply problems despite suspension of the Mystic furnace during December and January. More outside foundry iron is stocked, including malleable.

New York—Pig iron requirements show little change here, with supply adequate. Gray iron foundry operations have not improved greatly since beginning of the year.

Buffalo—No easing of supply conditions is noted in the merchant pig iron market here. Producers report no iron is being piled with diversified demand showing improvement.

Philadelphia—Blowing out of a blast furnace at Steelton, Pa., has tightened pig iron supply here although there is sufficient tonnage to meet requirements. The Steelton stack will be relined and may be down until mid-April.

San Francisco—Pig iron is more

plentiful. Foundries are not too rushed and they are consuming less. Cross-hauling is fading out and West Coast producers are trying to sell more in the "home" market.

Warehouse . . .

Warehouse Prices, Page 155

Cleveland—Over-all demand on warehouses in this district is reported sustained but individual orders are somewhat smaller. With distributors' stocks increasing, now estimated at 60 per cent of normal, consumers' tendency is to hold orders more closely to actual needs. Open-ending of the Controlled Materials Plan is expected to result in return of more normal marketing conditions, though effect of the decontrol action probably will not be noticeable much before third quarter.

Boston—Cold-rolled sheets have moved into the No. 1 spot as the tightest product with warehouses. Stocks of other critical products are improved, but in smaller sizes, leaving unbalanced inventories the major problem of distributors. Galvanized sheets are in ample supply.

New York—Inventories while still out of balance, are gradually improving. Even plates, structurals and bars are in slightly better supply on more sizes. Substantial volume of overdue tonnage has been delivered warehouses.

Chicago—Warehouses see no significant changes in their position or operations in first half because of

the CMP open-ending. More steel is expected as production expands but products in short supply probably will continue short.

Philadelphia—Warehouse demand has less zip, but this may be temporary. Normally, March is one of the best months of the year.

Canada . . .

Toronto, Ont.—Steel demand is maintained at high level. Mills are booked solidly through first quarter. Some signs of early easing in hot-rolled steel products supply are seen but no immediate improvement is expected in cold-rolled.

Consumers show more interest in European supplies. According to information here French steel producers are cutting prices to meet sales competition in Canada. German mills are not participating in the price cutting, but Belgian and Luxembourg mills are keeping pace with the French.

Purchasing agents point out that on bars the French base price f.o.b. Antwerp dropped to \$82.50 U.S., per 1000 kilos. That is believed to be bottom because steel shipped to Canada at a cost lower than home market value would be subject to the dumping duty. This price is still \$5 per ton above the home market value of bars in Belgium and Luxembourg.

French, Belgian and Luxembourg bars are available to Canadian consumers at seaboard at prices lower

Why LINK-BELT IDLERS require minimum lubrication and adjustment

CUTAWAY OF "100" ROLL

Concentrically counterbored and journaled full-length central tube and counterbored roll shell are continuously welded to dish heads to maintain balance and bearing alignment.

Precision roller bearings maintain alignment.

Large grease reservoir prolongs lubrication intervals.

Grease-in-dirt-out, cartridge type unit seal preserves lubricant. No springs, no loose parts, no sliding metal-to-metal contact.

By MINIMIZING maintenance . . . holding "down-time" to a new low . . . reducing power requirements—Link-Belt Roller Bearing Idlers save you money.

And, because of standardized design, Link-Belt gives you the famous "100" Idler or the heavy-duty "200" Idler at a cost lower than you'd expect. You can choose from the full Link-Belt line of troughing, impact-cushioning, belt training and flat belt idlers in a wide range of roll diameters and belt widths. A complete line to meet any requirement.

Remember, too, Link-Belt offers a complete line of other belt conveyor components—all types and sizes of take-ups, pulleys, trippers, back-stops and drives. Coupled with our broad belt conveyor engineering experience, this assures you of the right equipment for your handling requirement.

LINK-BELT
ROLLER BEARING IDLERS

LINK-BELT COMPANY: Chicago 9, Indianapolis 6, Philadelphia 40, Atlanta, Houston 1, Minneapolis 5, San Francisco 24, Los Angeles 33, Seattle 4, Toronto 8, Springs (South Africa). Offices, Factory Branch Stores and Distributors in Principal Cities. 12,581

man from U. S. sources, and in many cases from Canadian mills. Competition in Canada from European producers will be more noticeable to American suppliers than to Canadian mills. Heavy structurals are showing more stability than bars, prices for I-beams and channels being established at \$95 per metric ton f.o.b. Antwerp.

Hot and cold-rolled bars and galvanized sheets dropped \$13 per ton during the past month, but prices still are too high to be of interest here. There has been no reduction in the price of plates and these are priced above the Canadian market. Deliveries of European steel to Canada are 6 to 8 weeks ex-works, except for structurals, certain sizes which are available only on the basis of 3 to 4 months delivery. A possible reduction in ocean freight rates of \$3 per long ton is hoped for, but not before the opening of navigation.

Effective second quarter in Canada, hot-rolled sheets have been declared free from allocation and probably will be in free supply for remainder of this year. Cold-rolled sheets should be in better supply with the coming into production of new facilities at an Ontario mill. Shortage in galvanized sheets, especially lighter gages, will continue for some time. Demand for heavy plate is brisk and there is little prospect of early easing in present tight supply.

STRUCTURAL SHAPES . . .

STRUCTURAL STEEL PLACED

100 tons, state thruway bridge work, Greene county, New York, through Savin Construction Co., East Hartford, Conn., to the Harris Structural Steel Co., New York.
100 tons, hangars, air base, Limestone, Me., to Luria Engineering Co., New York, through Corps of Engineers, Boston.
25 tons, two state bridges, Boston-Fall River Expressway, Bridgewater and Raynham, Mass., to Bethlehem Steel Co. through J. P. Fitzgerald Construction Co., Boston, general contractor.
10 tons, galvanized, Seattle city light substation, to Bethlehem Pacific Coast Steel Corp., low \$28,462.

STRUCTURAL STEEL PENDING

100 tons, 163 transmission towers, etc., 150-mile line; bids to Bonneville Power Administration, Portland, Ore., Feb. 25.
10 tons, Elmendorf Air Field, Alaska, power plant; bids to U. S. Engineer, Seattle, Mar. 21.
10 tons, Washington state steamboat slough swing span; general contract to M. P. Butler, Seattle, low \$930,424.
10 tons, Bensalem high school, Bucks county, Pa., bids closed Feb. 18.
10 tons, steel frame building, steam heat and power plant and other facilities, Kodiak, Alaska, naval base; bids to Seventeenth Naval District, Seattle, Feb. 27.
10 tons, Reading railroad bridge, Montgomery county, Pa., bids closed Feb. 20.
10 tons, high school, Springfield township, Montgomery county, Pa., bids closed Feb. 18.
10 tons, including reinforcing, 274-ft. highway span, Josephine county, Oregon, bids to Bureau of Public Roads, Portland, Ore., Feb. 27.
Unstated, extension heat and power plant, steel frame, Elision Air Field, Alaska; bids to U. S. Engineer, Seattle, Mar. 7; involves also coal and ash handling facilities.
Unstated, maintenance shops, gas stations and other installations, Ladd Field, Alaska; to Grove, Shepherd, Wilson & Kruger, low \$1,018,281, two schedules to U. S. Engineer, Anchorage, Alaska.
Unstated, shops, gas stations and other facilities,

ties, Elision Field, Alaska; Peter Kiewit Sons' Co., Seattle, low \$557,727 to U. S. Engineer, Anchorage, Alaska.
Unstated, steel frame locomotive shop, Ft. Richardson, Alaska; bids to U. S. Engineer, Anchorage, Alaska, Mar. 11.

REINFORCING BARS . . .

REINFORCING BARS PLACED

190 tons, Washington state steamboat slough swing span, to Bethlehem Pacific Coast Steel Corp., Seattle; M. P. Butler, Seattle, general contractor.
185 tons, Washington state LaCamas bridge, to Bethlehem Pacific Coast Steel Corp., Seattle; Troy Burnham, general contractor.

REINFORCING BARS PENDING

300 tons, 7-story, 400-bed hospital, Elmendorf Field, Alaska; J. C. Boespflug Construction Co., Seattle, low \$8,445,400 to Alaska District U. S. Engineer.
Unstated, 1.5 million, 4-story office building for Pacific Telephone & Telegraph Co., Seattle; bids Feb. 26, selected contractors, to Jones & Binden, architects, Seattle.
Unstated, marine barracks, runway, etc., Adak, Alaska, navy station; general contract by Seventeenth Naval District, to Raber & Kief and Raber & Co., joint low, \$1,273,500.
Unstated, two 200-man barracks, Ladd Air Field, Alaska; general contract to Peter Kiewit Sons & Co., Seattle, low \$1,236,098.
Unstated, administration building, Ft. Richardson, Alaska; general contract to Field & Brezina Construction Co., low \$765,981.

PLATES . . .

PLATES PLACED

600 tons, oil storage tanks, Portland, Ore., for General Petroleum Co. to Chicago Bridge & Iron Co., Seattle.
222 tons, 1-inch structural plate, Corps of Engineers, Pittsburgh, to the United States Steel Export Co., New York.

100 tons, elevated water storage tank, Toppenish, Wash., to Pittsburgh-Des Moines Steel Co., Seattle branch, low \$78,207.

PLATES PENDING

Unstated, plans in preparation for expansion Manchester, Washington, naval fuel depot, \$2 million proposed project; bids soon.
Unstated, 1-million-gallon elevated water storage tank, Richmond Highlands; bids to Seattle, Feb. 18.

PIPE . . .

CAST IRON PIPE PENDING

100 tons, 3500 feet, 8-inch water pipe, class 150, or alternatives; bids to city clerk, J. E. Law, Port Angeles, Wash., Feb. 19.

RAILS, CARS . . .

RAILROAD CARS PLACED

Duluth, South Shore placed 100 fifty-ton gondola cars to the American Car & Foundry Co., New York.
Louisville & Nashville, 2000 freight cars to the Pullman-Standard Car Mfg. Co., Bessemer, Ala.; the Pressed Steel Car Co., Mt. Vernon, Ill.; and Bethlehem Steel Co., Johnstown, Pa.; list comprises 1000 forty-foot box cars, 500 fifty-foot box cars and 500 gondola cars.
Southern Pacific, 25 chair cars, 15 going to the Budd Co., Philadelphia, 10 to the Pullman-Standard Car Mfg. Co., Chicago.
Union Pacific, 70 passenger cars, reported placed with American Car & Foundry Co., New York; list includes 15 units equipped with domes.

RAILROAD CARS PENDING

Long Island, 112 electric passenger cars, contemplated as needed for complete modernization of the railroad's electric passenger car fleet; no indications as to how soon any of this equipment will be placed on inquiry; full rehabilitation of 558 of its present cars also is contemplated.

They picked a "READING" CRANE to shorten their load handling cycle ...

When this well-known stove manufacturer wanted to speed up assembly, he put his problem to "Reading" engineers. Installation of a 10-ton, double I-beam, cab-controlled "Reading" crane brought even greater results than expected. There are good reasons.

All "Reading" electric cranes — cab or floor controlled — are "job tailored". There is no extra cost for this special engineering service. Actually, costs go down, because motor, trolleys, brakes and hoisting units are assembled into a crane that fits your needs exactly. You get greater operating efficiency. More accurate spotting is possible. Precise speed control is assured. Moreover, maintenance costs are minimized because each unit can be removed and serviced individually without dismantling entire crane. Get complete information by writing for our latest 16-page bulletin, "The Why and How of Faster Production".

READING CRANES

This special fiber Pittsburgh Brush has removed excess solder from seam of can shown emerging from cleaning machine—at the American Can Company.

"Wouldn't be without them!"

say the men who use . . .

Power-driven Pittsburgh Brushes for longer life, better work!

Last longer, much safer—Cloth brushes formerly used at the American Can Co., Jersey City, to wipe excess solder from can seams lasted less than an hour, occasionally caught fire. Switching to special fiber Pittsburgh Brushes, American Can now gets better than 15 hours life per brush and the fire hazard has been eliminated. Supervisory personnel reports: "We wouldn't be without them!"

Last longer, do better job—In producing wall and ceiling panels, at the Barclay Manufacturing Co., New York City, dust caused by routing "mortar lines" settles on the panels, must be completely removed before panels can be bake-finished. Brushes originally used had a short life span, wore unevenly, and did so poor a job that many baked panels had to be completely refinished to pass inspection. Since even a "fairly good" brush would not do, Barclay searched for the "perfect" brush—and chose Pittsburgh! Result: Better work, and costly refinishing eliminated.

Last longer, better constructed—The Windalume Corporation, Kenvil, N. J., manufacturers of aluminum windows, uses Pittsburgh wire brushes to remove burrs caused by milling. The wire bristles on the brushes used formerly broke off easily. Windalume replaced them with Pittsburgh Brushes because they are better constructed—and Pittsburgh Brushes last longer!

WRITE TODAY FOR FREE BOOKLET!

Write today for a free copy of our booklet that shows, through actual case histories, how Pittsburgh can help cut your brushing costs. Address: PITTSBURGH PLATE GLASS COMPANY, Brush Div., Dept. W-11, 3221 Frederick Ave., Baltimore 29, Md.

Engineers Dwarfed by Regulating Gate

Powering over three engineers of the Consolidated Western Steel Division of U. S. Steel Corp. is the second of three 225-ton steel regulating gates for the Garrison Dam near Bismarck, N. D. The gate is completely fabricated and erected in a large work bay at the Maywood, Calif., factory of Consolidated Western. A third gate for the dam is nearing completion and will be shipped soon.

Breaking Ground for Buildings

Ground will be broken May 1, 1953, for Ceco Steel Products Corp.'s new Pittsburgh office and plant. The factory building will provide 80,000 square feet of manufacturing and warehousing space.

Agree to Sell Tilting Arcs

Pacific Airmotive Corp., Burbank, Calif., will manufacture and sell Rohr Tilting Arcs under terms of an exclusive licensing agreement with Rohr Aircraft Corp., Chula Vista, Calif.

Steber Announces Addition

Steber Mfg. Co., Broadview, Ill., announced an addition of about 18,000 square feet to installations for manufacture of outdoor lighting equipment and infrared heat lamp brooders.

New Representative Appointed

Pennsylvania Crusher Co., Philadelphia, appointed the Mine & Smelt-Supply Co., Denver and El Paso, Tex., as representatives in nine southwestern states.

Olin Forms Research Group

Olin Industries Inc., East Alton, Ill., announced formation of a General Research Organization which will conduct basic research and work

with all Olin manufacturing divisions on varied research problems.

Parker Appoints New Distributor

Florida Metals Inc., Jacksonville, Fla., will distribute industrial tube fittings and tube fabricating tools manufactured by the Parker Appliance Co., Cleveland.

Stokes Opens Laboratory

A new laboratory having complete facilities for testing and developing materials, equipment and processes for customers was opened at F. J. Stokes Machine Co., Philadelphia.

Florida Company Purchased

The Smith-Victory Corp., Buffalo, manufacturer of hair pins, purchased Mervin Curl Clip Co., Orlando, Fla., and will house part of the company in a plant addition in Buffalo.

American Cam Breaks Ground

American Cam Co. held ground-breaking ceremonies for a new plant at Bloomfield, Conn., on Jan. 10. The building will be completed about May 1.

Cory Production at Full Scale

Cory Corp., Chicago, reports that full scale production of three Fresh'n-Aire electric room air con-

Positions Wanted

REGISTERED PROFESSIONAL ENGINEER

15 years diversified electrical and mechanical development experience. Now employed as plant superintendent by company engaged in general machinery repair, motor repair, and manufacturing. Desires responsible supervisory position requiring above average ability. Small town not objectionable. Write Box 657, STEEL, Penton Bldg., Cleveland 13, Ohio.

BASIC STEEL PLANT MANAGER

10 years old, successfully experienced in works management. Have directed and coordinated staff services for safe, profitable operations. Prior experience as superintendent in steel producing and flat rolling departments. Write Box 660, STEEL, Penton Bldg., Cleveland 13, Ohio.

GOVERNMENT RELATIONS AND INFORMATION SPECIALIST wishes to represent industrial firm or trade association in its business contacts with the government in Washington. Moderate salary. Broad background of experience with the government and with private industry. Qualified business research analyst. Familiar with the metalworking industries. Permanent resident of Washington for more than 10 years. Top level references. Write Box 669, STEEL, Penton Bldg., Cleveland 13, Ohio.

PLANT MANAGER: M.I.T. GRADUATE WITH 15 years' experience in Plant Management, including Production planning, machine and plant loading, Material and tool control, quality control, purchasing, incentives, standard costs, variable budgets, overhead analysis and break-even charts, job evaluation, supervisory responsibility chart and labor relations. Capable administrator with excellent record. Write Box 671, STEEL, Penton Bldg., Cleveland 13, Ohio.

INDUSTRIAL ENGINEER—PLANT MANAGER age 37, college graduate. 15 years experience production planning, process and tool engineering, quality control, purchasing, standard costs and time study in home appliance manufacturing industry. Write Box 673, STEEL, Penton Bldg., Cleveland 13, Ohio.

Help Wanted

SMALL FABRICATING PLANT ESTIMATOR. Must have experience in take off, estimating for important parts of ships, et cetera. Must have 10 years experience as to layout and production. Warrants good salary for capable man in small town North Florida. Replies held confidential. Applicant must have good references. Write Box 672, STEEL, Penton Bldg., Cleveland 13, Ohio.

ASSISTANT TO GENERAL MANAGER

New England manufacturer of expanding line of automatic presses and progressive dieing machines seeks man as Factory Manager and assistant to General Manager. Must have broad experience in heavy machinery manufacturing, demonstrated executive ability, and M.E. degree. Excellent long range opportunity with attractive starting salary in our Henry & Wright Division. Send complete resume of qualifications to F. William Gray, Personnel Director, Emhart Mfg. Co., Hartford 1, Conn.

AGE NO BARRIER

We seek a man long experienced in stainless steel production who can train men to operate a continuous strip mill for hot and cold stainless steel. Unusual opportunity for someone now retired or in semi-retirement. Position for two years at least. In attractive Niagara Peninsula. Send application or resume to Robert Teasdale, Atlas Steels Limited, Welland, Ontario.

CHIEF METALLURGIST FOR SAW MANUFACTURING PLANT

Requirements: Graduate with at least five years experience in the fabrication and uses of metals.

BORG-WARNER CORPORATION
INDIANAPOLIS 9, INDIANA

WANTED

ESTIMATING AND DIE DESIGN ENGINEER — DROP FORGING

Must have experience in laying out multiple impression forging dies, and estimating of forgings, five pounds and under. Some die sinking and forge shop experience preferred. Additional opportunities in management available for person with proper qualifications.

Write Box 663, STEEL,

Penton Bldg. Cleveland 13, Ohio

Wanted

FORGE PLANT SUP'T.

With flat die forging experience in alloy and tool steels. Jobbing shop work. Must be capable of planning and expediting production and keeping modern equipment in good working condition. General knowledge of heat treating and rough turning, essential. Proven work record necessary. Salary open. Location: Ohio. Write stating details to

Box 668, STEEL

Penton Bldg., Cleveland 13, Ohio

Belgian metalworking Company seeks

LICENSING AGREEMENT

to manufacture in Belgium patented

STEEL SHEET PRODUCTS

Its modern equipment of shears, presses, welding machines, etc. is adapted to all sheet and platework up to ¼ inch thick. Excellent selling organization covering Western Europe.

Write to: LEON G. RUCQUOI, Representative of Belgian Federation of Metalworking Industries, 30 Rockefeller Plaza, New York 20, N. Y.

Steelmen Watch an Engineers Exhibit

An interested group of iron and steel operation and maintenance men view part of Westinghouse Electric Corp.'s iron and steel engineers exhibit. For the purpose of taking the product to the customer, the exhibit is shown, here, at Hammond, Ind. An engineer is showing how a crane control can gently lower a motor

iron, carbon steel and stainless steel castings.

Marine Division Formed

Strong, Carlisle & Hammond Co., Cleveland, formed a new marine division in its industrial supply department, to meet the needs of the marine industry.

Canadair Acquires Company

Canadair Ltd., Montreal, Canada, acquired control of Fleet Mfg. Ltd., Ft. Erie, Ont. Fleet will operate as a Canadair branch plant.

To Handle Disston Line

The Industrial Castings & Forgings Co., a sales organization, was appointed to handle the steel products line of Disston Co. in the Pittsburgh area. The Disston main plant is in Philadelphia.

Appoints Georgia Distributor

American SIP Corp., New York, appointed the Noland Co. Inc., Atlanta, as its distributor in Georgia.

GE Addition Approved

The Air Force approved construction of a million-dollar addition to General Electric Corp.'s plant near Johnson City, N. Y. The new building will be used for complete controlled testing of aircraft armament systems.

Steel Allotted for Refinery

The Petroleum Administration for Defense set aside 2828 tons of steel

for use in building a new oil refinery at Tacoma, Wash. The refinery will be built by the Pacific Oil & Refining Co.

A. Milne Acquires Warehouse

A. Milne & Co., New York, distributors of solid and hollow tool steels, announce the addition of a warehouse at 753 Chestnut St., Atlanta.

Chrysler Building Progresses

Work is proceeding in Newark, Del., on construction of a \$3.1 million government-owned plant to be built and operated by Chrysler Corp. for modification and final processing of military tanks for Army Ordnance.

Contract for Salem—Brosius

Salem-Brosius Inc., Pittsburgh, received from the National Advisory Committee for Aeronautics a contract for design and construction of two butterfly valves for use in aircraft propulsion research. The valves will be 15 feet in diameter.

Sylvania Plans Building

Sylvania Electric Products Inc. plans to spend between \$1.5 million and \$2 million in 1953 for expansion of radio and television manufacturing facilities in Buffalo.

Standard Sulphur To Build

A new company, Standard Sulphur Co., will soon begin building a \$450,000 mobile sulphur plant about 40 miles south of Houston.

Why not use Perforated Metal?

This Wesix Electric Heater shows a typical application of Hendrick Perforated Metal, combining utility and attractiveness. The heater guard is 20 gauge steel, with 3/16" x 1 1/2" side stagger perforations.

With facilities for producing any required shape and size of perforations in any commercially rolled metals, Hendrick invites inquiries from manufacturers who may be considering the use of perforated metal in connection with any of their products.

WORM GEARING—universal in its application—affords advantages for almost every power transmission job. Whether you want worm gearing sets or speed reducer units, you will find drives to meet your need in the complete Cleveland line.

Vickers Inc. hydraulic winch in operation on a Piasecki Hup-1 helicopter. Inset at left shows built-in Cleveland worm gearing.

Small **Cleveland** gearing speeds sea rescue

CLEVELAND worm gearing now has a part in a new kind of sea rescue. Just after the war, for the first time, a Vickers hydraulically-operated winch mounted on a helicopter hoisted two men to safety when an oil barge ran aground. Now use of the winch is standard practice, replacing hard-to-climb rope ladders previously used.

Vickers Inc. chose Cleveland worm gearing to drive the winch because it is small enough and light enough to satisfy rigid weight and bulk restrictions and is capable of governing efficiently sudden stops and starts and changes of direction involved in rescue work. To date Cleveland worm gearing has participated in over 1700 Korean missions.

Cleveland manufactures worm gearing and worm gear speed reducers in a wide range of types and sizes, large and small, to meet the requirements of any machinery builder or user. Write today for Catalog 400. The Cleveland Worm and Gear Company, 3270 East 80th Street, Cleveland 4, Ohio.

Affiliate: The Farval Corporation, Centralized Systems of Lubrication. In Canada: Peacock Brothers, Limited.

THE APPLICATION OF MAGNETIC AMPLIFIERS TO STEEL MILL CONTROL CIRCUITS

THE MAGNETIC AMPLIFIER

The magnetic amplifier as a motor control component has taken the electrical world by storm. Here is a unit that is simple in construction, that has no moving parts to wear out or get out of order . . . yet when properly designed and constructed and when properly engineered into a control scheme is capable of some of the most amazing control functions. Its response is swift, measured in a fraction of a second. It is accurate. It is immune to vibration and shock. Because of numerous installations Cutler-Hammer engineers have the knowledge and experience to properly apply the magnetic amplifier to control circuits of every kind.

Cutler-Hammer's practical knowledge of this newly useful component assures correct and efficient solution of your control problems.

With a background experience gained by more than 50 years' intimate contact with the control problems of the Steel Industry, Cutler-Hammer engineers now bring to the Industry the knowledge and practical benefits of recent developments of the magnetic amplifier. The simple electrical and mechanical construction, the absence of moving parts, the tremendous versatility, the immunity to shocks and vibration, and the dependability of the magnetic amplifier recommend it to any steel mill man seeking higher production, better performance and more uniform operation in a wide variety of mill applications. If you have a problem involving:

Tension control	Acceleration
Voltage regulation	Positioning
Speed control	or any combination of these,

bring it to Cutler-Hammer.

The adaptability which the magnetic amplifier has in its performance characteristics and the need for skilled engineering experience of the subject are factors that suggest its application by men *competent* to do so.

Versatility and dependability explain the great interest of the Industry in this new method of control; and the great benefits derived from its proper application tell why experienced mill men are coming to Cutler-Hammer. CUTLER-HAMMER, Inc., 1211

St. Paul Avenue, Milwaukee 1, Wisconsin.

Associate: Canadian Cutler-Hammer, Ltd., Toronto, Ontario.

Above, Cutler-Hammer Control Panel for mill and reel control on reversing strip mill, utilizing magnetic amplifiers.
